## O. Introduction

In this paper I want to consider not just the  $L$ -functions introduced by Artin [1] but the more general functions introduced by Weil [15]. To define these one needs the notion of a Weil group as described in [3]. This notion will be explained in the first paragraph. For now a rough idea will suffice. If  $E$  is a global field, that is an algebraic number field of finite degree over the rationals or a function field over a finite field,  $C_E$  will be the idèle class group of  $E$ . If  $E$  is a local field, that is the completion of a global field at some place [16], archimedean or nonarchimedean,  $C_E$  will be the multiplicative group of  $E$ . If  $K/E$  is a finite Galois extension the Weil group  $W_{K/E}$  is an extension of  $\mathfrak{G}(K/E)$ , the Galois group of  $K/E$ , by  $C_K$ . It is a locally compact topological group.

If  $E \subseteq E' \subseteq K$  and  $K/E$  is finite and Galois  $W_{K/E'}$  may be regarded as a subgroup of  $W_{K/E}$ . It is closed and of finite index. If  $E \subseteq K \subseteq L$  there is a continuous map of  $W_{L/E}$  onto  $W_{K/E}$ . Thus any representation of  $W_{K/E}$  may be regarded as a representation of  $W_{L/E}$ . In particular the representations  $\rho_1$  of  $W_{K_1/E}$  and  $\rho_2$  of  $W_{K_2/E}$  will be called equivalent if there is a Galois extension  $L/E$  containing  $K_1/E$  and  $K_2/E$  such that  $\rho_1$  and  $\rho_2$  determine equivalent representations of  $W_{L/E}$ . This allows us to refer to equivalence classes of representations of the Weil group of  $E$  without mentioning any particular extension field  $K$ .

In this paper a representation of  $W_{K/E}$  is understood to be a continuous representation  $\rho$  in the group of invertible linear transformations of a finite-dimensional complex vector space which is such that  $\rho(w)$  is diagonalizable, that is semisimple, for all  $w$  in  $W_{K/E}$ . Any one-dimensional representation of  $W_{K/E}$  can be obtained by inflating a one-dimensional representation of  $W_{E/E} = C_E$ . Thus equivalence classes of one-dimensional representations of the Weil group of  $E$  correspond to quasi-characters of  $C_E$ , that is, to continuous homomorphisms of  $C_E$  into  $\mathbb{C}^\times$ .

Suppose  $E$  is a local field. There is a standard way of associating to each equivalence class  $\omega$  of one-dimensional representations a meromorphic function  $L(s, \omega)$ . Suppose  $\omega$  corresponds to the quasi-character  $\chi_E$ . If  $E$  is nonarchimedean and  $\varpi_E$  is a generator of the prime ideal  $\mathcal{P}_E$  of  $O_E$ , the ring of integers in  $E$ , we set

$$L(s, \omega) = \frac{1}{1 - \chi_E(\varpi_E) |\varpi_E|^s}$$

if  $\chi_E$  is unramified. Otherwise we set  $L(s, \omega) = 1$ . If  $E = \mathbb{R}$  and

$$\chi_E(x) = (\operatorname{sgn} x)^m |x|^r$$

with  $m$  equal to 0 or 1 we set

$$L(s, \omega) = \pi^{-\frac{1}{2}(s+r+m)} \Gamma\left(\frac{s+r+m}{2}\right).$$

If  $E = \mathbb{C}$  and  $z \in E$  then, for us,  $|z|$  will be the square of the ordinary absolute value. If

$$\chi_E(z) = |z|^r z^m \bar{z}^n$$

where  $m$  and  $n$  are integers such that  $m+n \geq 0$ ,  $mn = 0$ , then

$$L(s, \omega) = 2(2\pi)^{-(s+r+m+n)} \Gamma(s+r+m+n)$$

It is not difficult to verify, and we shall do so later, that it is possible, in just one way, to define  $L(s, \omega)$  for all equivalence classes so that it has the given form when  $\omega$  is one-dimensional, so that

$$L(s, \omega_1 \oplus \omega_2) = L(s, \omega_1) L(s, \omega_2)$$

so that if  $E'$  is a separable extension of  $E$  and  $\omega$  is the equivalence class of the representation of the Weil group of  $E$  induced from a representation of the Weil group of  $E'$  in the class  $\Theta$  then  $L(s, \omega) = L(s, \Theta)$ .

Now take  $E$  to be a global field and  $\omega$  an equivalence class of representations of the Weil group of  $E$ . It will be seen later how, for each place  $v$ ,  $\omega$  determines an equivalence class  $\omega_v$  of representations of the Weil group of the corresponding local field  $E_v$ . The product

$$\prod_v L(s, \omega_v)$$

which is taken over all places, including the archimedean ones, will converge if the real part of  $s$  is sufficiently large. The function it defines can be continued to a function  $L(s, \omega)$  meromorphic in the whole complex plane. This is the Artin  $L$ -function associated to  $\omega$ . It is fairly well-known that if  $\tilde{\omega}$  is the class contragredient to  $\omega$  there is a functional equation connecting  $L(s, \omega)$  and  $L(1-s, \tilde{\omega})$ .

The factor appearing in the functional equation can be described in terms of the local data. To see how this is done we consider separable extensions  $E$  of the fixed local field  $F$ . If  $\Psi_F$  is a non-trivial additive character of  $F$  let  $\psi_{E/F}$  be the non-trivial additive character of  $E$  defined by

$$\psi_{E/F}(x) = \psi_F(S_{E/F}x)$$

where  $S_{E/F}x$  is the trace of  $x$ . We want to associate to every quasi-character  $\chi_E$  of  $C_E$  and every non-trivial additive character  $\psi_E$  of  $E$  a non-zero complex number  $\Delta(\chi_E, \psi_E)$ . If  $E$  is nonarchimedean, if  $\mathfrak{P}_E^m$  is the conductor of  $\chi_E$ , and if  $\mathfrak{P}_E^{-n}$  is the largest ideal on which  $\psi_E$  is trivial choose any  $\gamma$  with  $O_E\gamma = \mathfrak{P}_E^{m+n}$  and set

$$\Delta(\chi_E, \psi_E) = \chi_E(\gamma) \frac{\int_{U_E} \psi_E \left( \frac{\alpha}{\gamma} \right) \chi_E^{-1}(\alpha) d\alpha}{\left| \int_{U_E} \psi_E \left( \frac{\alpha}{\gamma} \right) \chi_E^{-1}(\alpha) d\alpha \right|}.$$

The right side does not depend on  $\gamma$ . If  $E = \mathbb{R}$ ,

$$\chi_E(x) = (\text{sgn}x)^m |x|^r$$

with  $m$  equal to 0 or 1, and  $\psi_E(x) = e^{2\pi i u x}$  then

$$\Delta(\chi_E, \psi_E) = (i \text{sgn}u)^m |u|^r.$$

If  $E = \mathbb{C}$ ,  $\psi_{\mathbb{C}}(z) = e^{4\pi i \text{Re}(wz)}$ , and

$$\chi_{\mathbb{C}}(z) = |z|^r z^m \bar{z}^n$$

with  $m + n \geq 0$ ,  $mn = 0$  then

$$\Delta(\chi_{\mathbb{C}}, \psi_{\mathbb{C}}) = i^{m+n} \chi_{\mathbb{C}}(w).$$

The bulk of this paper is taken up with a proof of the following theorem.

### Theorem A

Suppose  $F$  is a given local field and  $\psi_F$  a given non-trivial additive character of  $F$ . It is possible in exactly one way to assign to each separable extension  $E$  of  $F$  a complex number  $\lambda(E/F, \psi_F)$  and to each equivalence class  $\omega$  of representations of the Weil group of  $E$  a complex number  $\varepsilon(\omega, \Psi_{E/F})$  such that

(i) If  $\omega$  corresponds to the quasi-character  $\chi_E$  then

$$\varepsilon(\omega, \psi_{E/F}) = \Delta(\chi_E, \psi_{E/F}).$$

(ii)

$$\varepsilon(\omega_1 \oplus \omega_2, \psi_{E/F}) = \varepsilon(\omega_1, \psi_{E/F}) \varepsilon(\omega_2, \psi_{E/F}).$$

(iii) If  $\omega$  is the equivalence class of the representation of the Weil group of  $F$  induced from a representation of the Weil group of  $E$  in the class  $\theta$  then

$$\varepsilon(\omega, \psi_F) = \lambda(E/F, \psi_F)^{\dim \theta} \varepsilon(\theta, \psi_{E/F}).$$

$\alpha_F^s$  will denote the quasi-character  $x \longrightarrow |x|_F^s$  of  $C_F$  as well as the corresponding equivalence class of representations. Set

$$\varepsilon(s, \omega, \psi_F) = \varepsilon\left(\alpha_F^{s-\frac{1}{2}} \otimes \omega, \psi_F\right).$$

The left side will be the product of a non-zero constant and an exponential function.

Now take  $F$  to be a global field and  $\omega$  to be an equivalence class of representations of the Weil group of  $F$ . Let  $\mathbb{A}$  be the adèle group of  $F$  and let  $\psi_F$  be a non-trivial character of  $\mathbb{A}/F$ . For each place  $v$  let  $\psi_v$  be the restriction of  $\psi_F$  to  $F_v$ .  $\psi_v$  is non-trivial for each  $v$  and almost all the functions  $\varepsilon(s, \omega_v, \psi_v)$  are identically 1 so that we can form the product

$$\prod_v \varepsilon(s, \omega_v, \psi_v).$$

Its value will be independent of  $\psi_F$  and will be written  $\varepsilon(s, \omega)$ .

### Theorem B

*The functional equation of the  $L$ -function associated to  $\omega$  is*

$$L(s, \omega) = \varepsilon(s, \omega) L(1 - s, \tilde{\omega}).$$

This theorem is a rather easy consequence of the first theorem together with the functional equations of the Hecke  $L$ -functions.

For archimedean fields the first theorem says very little. For nonarchimedean fields it can be reformulated as a collection of identities for Gaussian sums. Four of these identities which we formulate as our four main lemmas are basic. All the others can be deduced from them by simple group-theoretic arguments. Unfortunately the only way at present that I can prove the four basic identities is by long and involved, although rather elementary, computations. However Theorem A promises to be of such importance for the theory of automorphic forms and group representations that we can hope that eventually a more conceptual proof of it will be found. The first and the second, which is the most difficult, of the four main lemmas are due to Dwork [6]. I am extremely grateful to him not only for sending me a copy of the dissertation of Lakkis [9] in which a proof of these two lemmas is given but also for the interest he has shown in this paper.

## Chapter One.

### Weil Groups

The Weil groups have many properties, most of which will be used at some point in the paper. It is impossible to describe all of them without some prolixity. To reduce the prolixity to a minimum I shall introduce these groups in the language of categories.

Consider the collection of sequences

$$S : C \xrightarrow{\lambda_1} G \xrightarrow{\mu} \mathfrak{G}$$

of topological groups where  $\lambda$  is a homeomorphism of  $C$  with the kernel of  $\mu$  and  $\mu$  induces a homeomorphism of  $G/\lambda C$  with  $\mathfrak{G}$ . Suppose

$$S_1 : C_1 \xrightarrow{\lambda_1} G_1 \xrightarrow{\mu_2} \mathfrak{G}_1$$

is another such sequence. Two continuous homomorphisms  $\varphi$  and  $\psi$  from  $G$  to  $G_1$  which take  $C$  into  $C_1$  will be called equivalent if there is a  $c$  in  $C_1$  such that  $\psi(g) = c\varphi(g)c^{-1}$  for all  $g$  in  $G$ .  $\mathcal{S}$  will be the category whose objects are the sequences  $S$  and  $\text{Hom}_{\mathcal{S}_0}(S, S_1)$  will be the collection of these equivalence classes.  $\mathcal{S}$  will be the category whose objects are the sequences  $S$  for which  $C$  is locally compact and abelian and  $\mathfrak{G}$  is finite; if  $S$  and  $S_1$  belong to  $\mathcal{S}$

$$\text{Hom}_{\mathcal{S}}(S, S_1) = \text{Hom}_{\mathcal{S}_0}(S, S_1).$$

Let  $P_1$  be the functor from  $\mathcal{S}$  to the category of locally compact abelian groups which takes  $S$  to  $C$  and let  $P_2$  be the functor from  $\mathcal{S}$  to the category of finite groups which takes  $S$  to  $\mathfrak{G}$ . We have to introduce one more category  $\mathcal{S}_{1,0}$ . The objects of  $\mathcal{S}_1$  will be the sequences on  $\mathcal{S}$  for which  $G^c$ , the commutator subgroup of  $G$ , is closed. Moreover the elements of  $\text{Hom}_{\mathcal{S}_1}(S, S_1)$  will be the equivalence classes in  $\text{Hom}_{\mathcal{S}}(S, S_1)$  all of whose members determine homeomorphisms of  $G$  with a closed subgroup of finite index in  $G_1$ .

If  $S$  is in  $\mathcal{S}_1$  let  $V(S)$  be the topological group  $G/G^c$ . If  $\Phi \in \text{Hom}_{\mathcal{S}_1}(S, S_1)$  let  $\varphi$  be a homeomorphism in the class  $\Phi$  and let  $\overline{G} = \varphi(G)$ . Composing the map  $G_1/G_1^c \rightarrow \overline{G}/\overline{G}^c$  given by the transfer with the map  $\overline{G}/\overline{G}^c \rightarrow G/G^c$  determined by the inverse of  $\varphi$  we obtain a map  $\Phi_v : V(S_1) \rightarrow V(S)$  which depends only on  $\Phi$ . The map  $S \rightarrow V(S)$  becomes a contravariant functor from  $\mathcal{S}_1$  to the category of locally compact abelian groups. If  $S$  is the sequence

$$C \rightarrow G \rightarrow \mathfrak{G}$$

the transfer from  $G$  to  $C$  determines a homomorphism  $\tau$  from  $G/G^c$  to the group of  $G$ -invariant elements in  $C$ .  $\tau$  will sometimes be regarded as a map from  $G$  to this subgroup.

The category  $\mathcal{E}$  will consist of all pairs  $K/F$  where  $F$  is a global or local field and  $K$  is a finite Galois extension of  $F$ .  $\text{Hom}(K/F, L/E)$  will be a certain collection of isomorphisms of  $K$  with a subfield of  $L$  under which  $F$  corresponds to a subfield of  $E$ . If the fields are of the same type, that is all global or all local we demand that  $E$  be finite and separable over the image of  $F$ . If  $F$  is global and  $E$  is local we demand that  $E$  be finite and separable over the closure of the image of  $F$ . I want to turn the map which associates to each  $K/F$  the group  $C_K$  into a contravariant functor which I will denote by  $C^*$ . If  $\varphi : K/F \rightarrow L/E$  and  $F$  and  $E$  are of the same type let  $K_1$  be the image of  $K$  in  $L$  and let  $\varphi_{C^*}$  be the composition of  $N_{L/K_1}$  with the inverse of  $\varphi$ . If  $F$  is global and  $E$  is local let  $K_1$  be the closure in  $L$  of the image of  $K$ . As usual  $C_{K_1}$  may be considered a subgroup of the group of idèles of  $K$ .  $\varphi_{C^*}$  is the composition of  $N_{L/K_1}$  with the projection of the group of idèles onto  $C_K$ .

If  $K$  is given let  $\mathcal{E}^K$  be the subcategory of  $\mathcal{E}$  whose objects are the extensions with the larger field equal to  $K$  and whose maps are equal to the identity on  $K$ . Let  $C_*$  be the functor on  $\mathcal{E}^K$  which takes  $K/F$  to  $C_F$ . If  $F$  is given let  $\mathcal{E}_F$  have as objects the extensions with the smaller field equal to  $F$ . Its maps are to equal the identity on  $F$ .

A Weil group is a contravariant functor  $W$  from  $\mathcal{E}$  to  $\mathcal{S}$  with the following properties:

- (i)  $P_1 \circ W$  is  $C^*$ .
- (ii)  $P_2 \circ W$  is the functor  $\mathfrak{G} : L/F \rightarrow \mathfrak{G}(L/F)$ .
- (iii) If  $\varphi \in \mathfrak{G}(L/F) \subseteq \text{Hom}(L/F, L/F)$  and  $g$  is any element of  $W_{L/F}$ , the middle group of the sequence  $W(L/F)$ , whose image in  $\mathfrak{G}(L/F)$  is  $\varphi$  then the map  $h \rightarrow ghg^{-1}$  is in the class  $\varphi_w$ .
- (iv) The restriction of  $W$  to  $\mathcal{E}^K$  takes values in  $\mathcal{S}_1$ . Moreover, if  $K/F$  belongs to  $\mathcal{E}^K$

$$\tau : W_{K/F} / W_{K/F}^c \rightarrow C_F$$

is a homeomorphism. Finally, if  $\varphi : K/F \rightarrow K/E$  is the identity on  $K$  and  $\Phi = \varphi_w$  then the diagram

$$\begin{array}{ccc} W_{K/F} / W_{K/F}^c & \xrightarrow{\Phi_v} & W_{K/E} / W_{K/E}^c \\ \tau \downarrow & & \downarrow \tau \\ C_F & \xrightarrow{\varphi_{C^*}} & C_E \end{array}$$

is commutative and if  $\psi : F/F \rightarrow K/F$  is the imbedding,  $\psi_W$  is  $\tau$ .

Since the functorial properties of the Weil group are not all discussed by Artin and Tate, we should review their construction of the Weil group pointing out, when necessary, how the functorial properties arise. There is associated to each  $K/F$  a fundamental class  $\alpha_{K/F}$  in  $H^2(\mathfrak{G}(K/F), C_K)$ . The group  $W(K/F)$  is any extension of  $\mathfrak{G}(K/F)$  by  $C_K$  associated to this element. We have to show, at least, that if  $\varphi : K/F \rightarrow L/E$  the diagram

$$\begin{array}{ccccccc} 1 & \longrightarrow & C_L & \longrightarrow & W_{L/E} & \longrightarrow & \mathfrak{G}(L/E) \longrightarrow 1 \\ & & \downarrow \varphi_{C^*} & & & & \downarrow \varphi_{\mathfrak{G}} \\ 1 & \longrightarrow & C_K & \longrightarrow & W_{K/F} & \longrightarrow & \mathfrak{G}(K/F) \longrightarrow 1 \end{array}$$

can be completed to a commutative diagram by inserting  $\hat{\varphi} : W_{L/E} \rightarrow W_{K/F}$ . The map  $\varphi_{C^*}$  commutes with the action of  $\mathfrak{G}(L/E)$  on  $C_L$  and  $C_K$  so that  $\hat{\varphi}$  exists if and only if  $\varphi_{C^*}(\alpha_{L/E})$  is the restriction  $\varphi_{\mathfrak{G}}^*(\alpha_{K/F})$  of  $\alpha_{K/F}$  to  $\mathfrak{G}(L/E)$ . If this is so, the collection of equivalence classes to which  $\hat{\varphi}$  may belong is a principal homogeneous space of  $H^1(\mathfrak{G}(L/E), C_K)$ . In particular, if this group is trivial, as it is when  $\varphi_{\mathfrak{G}}$  is an injection, the class of  $\hat{\varphi}$  is uniquely determined.

An examination of the definition of the fundamental class and shows that it is canonical. In other words, if  $\varphi$  is an isomorphism of  $K$  and  $L$  and of  $F$  and  $E$ , then  $\varphi_{\mathfrak{G}}^*(\alpha_{K/F}) = \varphi^{-1}\alpha_{L/E} = \varphi_{C^*}(\alpha_{L/E})$ . If  $K = L$  and  $\varphi$  is the identity on  $K$ , the relation  $\varphi_{\mathfrak{G}}^*(\alpha_{K/F}) = \alpha_{L/E} = \varphi_{C^*}(\alpha_{L/E})$  is one of the basic properties of the fundamental class. Thus in these two cases  $\hat{\varphi}$  exists and its class is unique. Now take  $K$  to be global and  $L$  local. Suppose at first that  $K$  is contained in  $L$ , that its closure is  $L$ , and that  $F = K \cap E$ . Then, by the very definition of  $\alpha_{K/F}$ ,  $\varphi_{\mathfrak{G}}^*(\alpha_{K/F}) = \varphi_{C^*}(\alpha_{L/E})$ . More generally, if  $K_1$  is the image of  $K$  in  $L$ , and  $F_1$  the image of  $F$  in  $E$ , we can write  $\varphi$  as  $\varphi_1\varphi_2\varphi_3$  where  $\varphi_3 : K/F \rightarrow K_1/F_1$ ,  $\varphi_2 : K_1/F_1 \rightarrow K_1/K_1 \cap E$ , and  $\varphi_1 : K_1/K_1 \cap E \rightarrow L/E$ .  $\hat{\varphi}_3$  and  $\hat{\varphi}_2$  exist. If the closure of  $K_1$  is  $L$  then  $\hat{\varphi}_1$  and therefore  $\hat{\varphi} = \hat{\varphi}_3\hat{\varphi}_2\hat{\varphi}_1$  also exist. The class of  $\hat{\varphi}$  is uniquely determined.

Artin and Tate show that  $W_{K/F}^c$  is a closed subgroup of  $W_{K/F}$  and that  $\tau$  is a homeomorphism of  $W_{K/F}/W_{K/F}^c$  and  $C_F$ . Granted this, it is easy to see that the restriction of  $W$  to  $\xi^K$  takes values in  $\mathcal{S}_1$ . Suppose we have the collection of fields in the diagram with  $L$  and  $K$  normal over  $F$  and  $L$  and  $K'$  normal over  $F'$ . Let  $\alpha, \beta$ , and  $\nu$  be the imbeddings  $\alpha : L/F \rightarrow L/K$ ,  $\beta : L/F' \rightarrow L/K'$ ,  $\nu : L/F \rightarrow L/F'$ .

We have shown the existence of  $\hat{\alpha}$ ,  $\hat{\beta}$ , and  $\hat{\nu}$ . It is clear that  $\hat{\nu}\hat{\beta}(W_{L/K'})$  is contained in  $\hat{\alpha}(W_{L/K})$ . Thus we have a natural map

$$\pi : \hat{\nu}\hat{\beta}(W_{L/K'})/\hat{\nu}\hat{\beta}(W_{L/K'}^c) \longrightarrow \hat{\alpha}(W_{L/K})/\hat{\alpha}(W_{L/K}^c).$$

Let us verify that the diagram

$$\begin{array}{ccc} W_{L/K}/W_{L/K'}^c & \longrightarrow & \hat{\nu}\hat{\beta}(W_{L/K'})/\hat{\nu}\hat{\beta}(W_{L/K'}^c) \xrightarrow{\pi} \hat{\alpha}(W_{L/K})/\hat{\alpha}(W_{L/K}^c) \longrightarrow W_{L/K}/W_{L/K}^c \\ \downarrow \tau & & \downarrow \tau \\ C_{k'} & \xrightarrow{N_{K'/K}} & C_k \end{array} \quad (\text{A})$$

is commutative. To see this let  $W_{L/K'}$  be the disjoint union

$$\bigcup_{i=1}^r C_K h_i.$$

Then we can choose  $h'_i, g'_j$ ,  $1 \leq i \leq r$ ,  $1 \leq j \leq s$  so that  $W_{L/K}$  is the disjoint union

$$\bigcup_{i=1}^r \bigcup_{j=1}^s C_K g'_j h'_i$$

and  $\hat{\nu}\hat{\beta}(h'_i) = \hat{\alpha}(h_i)$ . Using these coset representatives to compute the transfer one immediately verifies the assertion. We should also observe that the transitivity of the transfer implies the commutativity of the diagram

$$\begin{array}{ccc} W_{K/F}/W_{K/F}^c & \xrightarrow{\Phi_v} & W_{K/F'}/W_{K/F'}^c \\ \tau \downarrow & & \downarrow \\ C_F & \xrightarrow{\varphi_{C^*}} & C_{F'} \end{array}$$

if  $\Phi$  is the class of an imbedding  $\widehat{\varphi}$  where  $\varphi$  is an imbedding  $K/F \longrightarrow K/F'$ .

We have still not defined  $\varphi_W$  for all  $\varphi$ . However we have defined it when  $\varphi$  is an isomorphism of the two larger fields or when the second large field is the closure of the first. Moreover the definition is such that the third condition and all parts of the fourth condition except the last are satisfied. The last condition of (iv) can be made a definition without violating (i) and (ii). What we do now is show that there is one and only one way of extending the definition of  $\varphi_W$  to all  $\varphi$  without violating conditions (i) or (ii) and the functorial property.

Suppose  $F \subseteq K \subseteq L$ ,  $K/F$  and  $L/F$  are Galois, and  $\psi$  is the imbedding  $L/F \longrightarrow L/K$ . It is observed in Artin and Tate that there is one and only class of maps  $\{\theta\}$  which make the following diagram commutative

$$\begin{array}{ccccccc} 1 & \longrightarrow & W_{L/K}/W_{L/K}^c & \longrightarrow & \widehat{\psi}W_{L/K}/\widehat{\psi}W_{L/K}^c & \longrightarrow & W_{L/F}/\widehat{\psi}W_{L/K}^c \longrightarrow W_{L/F}/\widehat{\psi}W_{L/K} \longrightarrow 1 \\ & & \tau \downarrow & & \downarrow \theta & & \downarrow \\ 1 & \longrightarrow & C_K & \longrightarrow & W_{K/F} & \longrightarrow & \mathfrak{G}(K/F) \longrightarrow 1. \end{array}$$

The homomorphism on the right is that deduced from

$$W_{L/F}/W_{L/K} = \mathfrak{G}(L/F)/\mathfrak{G}(L/K) \simeq \mathfrak{G}(K/F).$$

Let  $\varphi$ ,  $\mu$ , and  $\nu$  be imbeddings  $\varphi : K/F \longrightarrow L/F$ ,  $\mu : K/K \longrightarrow L/K$ ,  $\nu : K/F \longrightarrow K/K$ . Then  $\psi \circ \varphi = \mu \circ \nu$ , so that  $\widehat{\nu} \circ \widehat{\mu} = \widehat{\varphi} \circ \widehat{\psi}$ . Moreover  $\widehat{\nu} \circ \widehat{\mu}$  is the composition of the map  $\tau : W_{L/K} \longrightarrow C_K$  and the imbedding of  $C_K$  in  $W_{K/F}$ . Thus the kernel of  $\widehat{\varphi}$  contains  $\widehat{\psi}W_{L/K}^c$  so that  $\widehat{\varphi} \circ \widehat{\psi}$  restricted to  $W_{L/K}/W_{L/K}^c$  must be  $\tau$  and the only possible choice for  $\widehat{\varphi}$  is, apart from equivalence,  $\theta$ . To see that this choice does not violate the second condition observe that the restriction of  $\tau$  to  $C_L$  will be  $N_{L/K}$  and that  $\widehat{\psi}$  is the identity on  $C_L$ .

Denote the map  $\theta : W_{L/F} \longrightarrow W_{K/F}$  by  $\theta_{L/K}$  and the map  $\tau : W_{K/F} \rightarrow C_K$  by  $\tau_{K/F}$ . It is clear that  $\tau_{K/F} \circ \theta_{L/K}$  is the transfer from  $W_{L/F}/W_{L/F}^c$  to  $\widehat{\psi}W_{L/K}/\widehat{\psi}W_{L/K}^c$  followed by the transfer from  $\widehat{\psi}W_{L/K}/\widehat{\psi}W_{L/K}^c$  to  $\widehat{\psi}C_L = C_F$ . By the transitivity of the transfer  $\tau_{K/F} \circ \theta_{L/K} = \tau_{L/F}$ . It follows immediately that if  $F \subseteq K \subseteq L \subseteq L'$  and all extensions are Galois the map  $\theta_{L'/K}$  and  $\theta_{L/K}\theta_{L'/L}$  are in the same class.

Suppose that  $\varphi$  is an imbedding  $K/F \longrightarrow K'/F'$  and choose  $L$  so that  $K' \subseteq L$  and  $L/F$  is Galois. Let  $\psi : K'/F' \longrightarrow L/F'$ ,  $\mu : K/F \longrightarrow L/F$ ,  $\nu : L/F \longrightarrow L/F'$  be imbeddings. Then  $\psi \circ \varphi = \nu \circ \mu$  so that  $\widehat{\mu} \circ \widehat{\nu} = \widehat{\varphi} \circ \widehat{\psi}$ . If  $\alpha : L/F \longrightarrow L/K$ ,  $\beta : L/F' \longrightarrow L/K'$  are the

imbeddings then the kernel of  $\hat{\psi}$  is  $\hat{\nu}\hat{\beta}W_{L/K'}^c$ , which is contained in  $\hat{\alpha}W_{L/K}^c$  the kernel of  $\hat{\mu}$ . Thus there is only one way to define  $\hat{\varphi}$  so that  $\hat{\mu} \circ \hat{\nu} = \hat{\varphi} \circ \hat{\psi}$ . The diagram

$$\begin{array}{ccccc} W_{L/K'}/W_{L/K'}^c & \xrightarrow{\hat{\beta}} & W_{L/F'}/\hat{\beta}W_{L/K'}^c & \xrightarrow{\hat{\psi}} & W_{K'/F'} \\ & & \downarrow \hat{\nu} & & \downarrow \hat{\varphi} \\ & & W_{L/F}/\hat{\nu}\hat{\beta}W_{L/K'}^c & \longrightarrow & W_{L/F}/\hat{\alpha}W_{L/K}^c \xrightarrow{\hat{\mu}} W_{K/F} \end{array}$$

will be commutative. Since  $\hat{\psi} \circ \hat{\beta} = \tau_{L/K'}$  and  $\hat{\mu} \circ \hat{\alpha} = \tau_{K/F}$  diagram (A) shows that  $\hat{\varphi}$  has the required effect on  $C_K$ .

To define  $\varphi_W$  in general, we observe that every  $\varphi$  is the composition of isomorphisms, imbeddings of fields of the same type, and a map  $K/F \longrightarrow K'/F'$  where  $K$  is global,  $K'$  is local,  $K'$  is the closure of  $K$ , and  $F = F' \cap K$ . Of course the identity

$$(\varphi \circ \psi)_W = \psi_W \varphi_W$$

must be verified. I omit the verification which is easy enough. The uniqueness of the Weil groups in the sense of Artin and Tate implies that the functor  $W$  is unique up to isomorphism.

The sequence

$$S(n, \mathbb{C}) : GL(n, \mathbb{C}) \xrightarrow{\text{id}} GL(n, \mathbb{C}) \longrightarrow 1$$

belongs to  $\mathcal{S}_1$ . If  $S : C \longrightarrow G \longrightarrow \mathfrak{G}$  belongs to  $\mathcal{S}_1$  then

$$\text{Hom}_{\mathcal{S}_0}(S, S(n, \mathbb{C}))$$

is the set of equivalence classes of  $n$ -dimensional complex representations of  $G$ . Let  $\Omega_n(S)$  be the set of all  $\Phi$  in  $\text{Hom}_{\mathcal{S}_0}(S, S(n, \mathbb{C}))$  such that, for each  $\varphi \in \Phi$ ,  $\varphi(g)$  is semi-simple for all  $g$  in  $G$ .  $\Omega_n(S)$  is a contravariant functor of  $S$  and so is  $\Omega(S) = \bigcup_{n=1}^{\infty} \Omega_n(S)$ . On the category  $\mathcal{S}_1$ , it can be turned into a covariant functor. If  $\psi : S \longrightarrow S_1$ , if  $\Phi \in \Omega(S)$ , and if  $\varphi \in \Phi$ , let  $\psi$  associate to  $\Phi$  the matrix representations corresponding to the induced representation  $\text{Ind}(G_1, \psi(G), \varphi \circ \psi^{-1})$ . It follows from the transitivity of the induction process that  $\Omega$  is a covariant functor of  $\mathcal{S}_1$ .

To be complete a further observation must be made.

**Lemma 1.1** Suppose  $H$  is a subgroup of finite index in  $G$  and  $\rho$  is a finite-dimensional complex representation of  $H$  such that  $\rho(L)$  is semi-simple for all  $h$  in  $H$ . If

$$\sigma = \text{Ind}(G, H, \rho)$$

then  $\sigma(g)$  is semi-simple for all  $g$ .

$H$  contains a subgroup  $H_1$  which is normal and of finite index in  $G$ , namely, the group of elements acting trivially on  $H \setminus G$ . To show that a non-singular matrix is semi-simple one has only to show that some power of it is semi-simple. Since  $\sigma^n(g) = \sigma(g^n)$  and  $g^n$  belongs to  $H_1$  for some  $n$  we need only show that  $\sigma(g)$  is semi-simple for  $g$  in  $H_1$ . In that case  $\sigma(g)$  is equivalent to  $\sum_{i=1}^r \oplus \rho(g_i g g_i^{-1})$  if  $G$  is the disjoint union

$$\bigcup_{i=1}^r H g_i$$

Suppose  $L/F$  and  $K/F$  belong to  $\mathcal{E}_F$  and  $\varphi \in \text{Hom}_{\mathcal{E}_F}(L/F, K/F)$ . Since the maps of the class  $\varphi_W$  all take  $W_{K/F}$  onto  $W_{L/F}$  the associated map  $\Omega(W(L/F)) \longrightarrow \Omega(W(K/F))$  is injective. Moreover it is independent of  $\varphi$ . If  $L_1/F$  and  $L_2/F$  belong to  $\mathcal{E}_F$  there is an extension  $K/F$  and maps  $\varphi_1 \in \text{Hom}_{\mathcal{E}_F}(L_1/F, K/F)$ ,  $\varphi_2 \in \text{Hom}_{\mathcal{E}_F}(L_2/F, K/F)$ .  $\omega_1$  in  $\Omega(W(L_1/F))$  and  $\omega_2$  in  $\Omega(W(L_2/F))$  have the same image in  $\Omega(W(K/F))$  for one such  $K$  if and only if they have the same image for all such  $K$ . If this is so we say that  $\omega_1$  and  $\omega_2$  are equivalent. The collection of equivalence classes will be denoted by  $\Omega(F)$ . Its members are referred to as equivalence classes of representations of the Weil group of  $F$ .

Let  $\mathcal{F}$  be the category whose objects are local and global fields. If  $F$  and  $E$  are of the same type  $\text{Hom}_{\mathcal{F}}(F, E)$  consists of all isomorphisms of  $F$  with a subfield of  $E$  over which  $E$  is separable. If  $F$  is global and  $E$  is local  $\text{Hom}_{\mathcal{F}}(F, E)$  consists of all isomorphisms of  $F$  with a subfield of  $E$  over whose closure  $E$  is separable.  $\Omega(F)$  is clearly a covariant functor on  $\mathcal{F}$ . Let  $\mathcal{F}_{\text{gl}}$ , and  $\mathcal{F}_{\text{loc}}$  be the subcategories consisting of the global and local fields respectively. Suppose  $F$  and  $E$  are of the same type and  $\varphi \in \text{Hom}_{\mathcal{F}}(F, E)$ . If  $\omega \in \Omega(E)$  choose  $K$  so that  $\omega$  belongs to  $\Omega(W(K/E))$ . We may assume that there is an  $L/F$  and an isomorphism  $\psi$  from  $L$  onto  $K$  which agrees with  $\varphi$  on  $F$ . Then  $\psi_W : W_{K/E} \longrightarrow W_{L/F}$  is an injection. Let  $\theta$  be the equivalence class of the representation

$$\sigma = \text{Ind}(W_{L/F}, \psi_W(W_{K/E}), \rho \circ \psi_W^{-1})$$

with  $\rho$  in  $\omega$ . I claim that  $\theta$  is independent of  $K$  and depends only on  $\omega$  and  $\varphi$ . To see this it is enough to show that if  $L \subseteq L'$ ,  $L'/F$  is Galois,  $\psi'$  is an isomorphism from  $L'$  to  $K'$  which agrees with  $\psi$  on  $L$ , and  $\rho'$  is a representation of  $W_{K'/F}$  in  $\omega$  the class of

$$\sigma' = \text{Ind}(W_{L'/F}, \psi'_W(W_{K'/E}), \rho' \circ \psi'_W^{-1})$$

is also  $\theta$ . Suppose  $\mu$  is a map from  $W_{K'/E}$  to  $W_{K/E}$  associated to the imbedding  $K/E \longrightarrow K'/E$  and  $\nu$  is a map from  $W_{L'/F}$  to  $W_{L/F}$  associated to the imbedding  $L/F \longrightarrow L'/F$ .

We may suppose that  $\psi_W \circ \mu = \nu \circ \psi'_W$ . The kernel of  $\mu$  is  $W_{K'/K}^c$  if, for simplicity of notation,  $W_{K'/K}$  is regarded as a subgroup of  $W_{K'/E}$  and that of  $\nu$  is  $W_{L'/L}^c$ . Moreover  $\psi'_W(W_{K'/K}^c) = W_{L'/L}^c$ . Take  $\rho' = \rho \circ \mu$ . Then  $\sigma$  acts on the space  $V$  of functions  $f$  on  $W_{K/F}$  satisfying  $f(vw) \equiv \rho(\psi_w^{-1}(h))f(w)$  for  $v$  in  $\psi_w(W_{K/E})$ . Let  $V'$  be the analogous space on which  $\sigma'$  acts. Then

$$V' = \{f \circ \nu \mid f \in V\}.$$

The assertion follows. Thus  $\Omega(F)$  is a contravariant functor on  $\mathcal{F}_{g\ell}$  and  $\mathcal{F}_{\text{loc}}$ .

After this laborious and clumsy introduction we can set to work and prove the two theorems. The first step is to reformulate Theorem A.

## Chapter Two.

### The Main Theorem

It will be convenient in this paragraph and at various later times to regard  $W_{K/E}$  as a subgroup of  $W_{K/F}$  if  $F \subseteq E \subseteq K$ . If  $F \subseteq E \subseteq L \subseteq K$  we shall also occasionally take  $W_{L/E}$  to be  $W_{K/E}/W_{K/L}^c$ .

If  $K/F$  is finite and Galois,  $\mathcal{P}(K/F)$  will be the set of extensions  $E'/E$  with  $F \subseteq E \subseteq E' \subseteq K$  and  $\mathcal{P}_\circ(K/F)$  will be the set of extensions in  $\mathcal{P}(K/F)$  with the lower field equal to  $F$ .

### Theorem 2.1

*Suppose  $K$  is a Galois extension of the local field  $F$  and  $\psi_F$  is a given non-trivial additive character of  $F$ . There is exactly one function  $\lambda(E/F, \psi_F)$  defined on  $\mathcal{P}_\circ(K/F)$  with the following two properties*

(i)

$$\lambda(F/F, \psi_F) = 1.$$

(ii) *If  $E_1, \dots, E_r, E'_1, \dots, E'_s$  are fields lying between  $F$  and  $K$ , if  $\chi_{E_i}, 1 \leq i \leq r$ , is a quasi-character of  $C_{E_i}$ , if  $\chi_{E'_j}, 1 \leq j \leq s$ , is a quasi-character of  $C_{E'_j}$ , and if*

$$\bigoplus_{i=1}^r \text{Ind}(W_{K/F}, W_{K/E_i}, \chi_{E_i})$$

*is equivalent to*

$$\bigoplus_{j=1}^s \text{Ind}(W_{K/F}, W_{K/E'_j}, \chi_{E'_j})$$

*then*

$$\prod_{i=1}^r \Delta(\chi_{E_i}, \psi_{E_i/F}) \lambda(E_i/F, \psi_F)$$

*is equal to*

$$\prod_{j=1}^s \Delta(\chi_{E'_j}, \psi_{E'_j/F}) \lambda(E'_j/F, \psi_F).$$

A function satisfying the conditions of this theorem will be called a  $\lambda$ -function. It is clear that the function  $\lambda(E/F, \psi_F)$  of Theorem A when restricted to  $\mathcal{P}_\circ(K/F)$  becomes a  $\lambda$ -function. Thus the uniqueness in this theorem implies at least part of the uniqueness of Theorem A. To show how this theorem implies all of Theorem A we have to anticipate some simple results which will be proved in paragraph 4.

First of all a  $\lambda$ -function can never take on the value 0. Moreover, if  $F \subseteq K \subseteq L$  the  $\lambda$ -function on  $\mathcal{P}_\circ(K/F)$  is just the restriction to  $\mathcal{P}_\circ(K/F)$  of the  $\lambda$ -function on  $\mathcal{P}_\circ(L/F)$ . Thus  $\lambda(E/F, \psi_F)$  is defined independently of  $K$ . Finally if  $E \subseteq E' \subseteq E''$

$$\lambda(E''/E, \psi_E) = \lambda(E''/E', \psi_{E'/E})\lambda(E'/E, \psi_E)^{[E'':E']}.$$

We also have to use a form of Brauer's theorem [4]. If  $G$  is a finite group there are nilpotent subgroups  $N_1, \dots, N_m$ , one-dimensional representations  $\chi_1, \dots, \chi_m$  of  $N_1, \dots, N_m$  respectively, and integers  $n_1, \dots, n_m$  such that the trivial representation of  $G$  is equivalent to

$$\bigoplus_{i=1}^m n_i \text{Ind}(G, N_i, \chi_i).$$

The meaning of this when some of the  $n_i$  are negative is clear

### Lemma 2.2

*Suppose  $F$  is a global or local field and  $\rho$  is a representation of  $W_{K/F}$ . There are intermediate fields  $E_1, \dots, E_m$  such that  $\mathfrak{G}(K/E_i)$  is nilpotent for  $1 \leq i \leq m$ , one-dimensional representations  $\chi_{E_i}$  of  $W_{K/E_i}$ , and integers  $n_1, \dots, n_m$  such that  $\rho$  is equivalent to*

$$\bigoplus_{i=1}^m n_i \text{Ind}(W_{K/F}, W_{K/E_i}, \chi_{E_i}).$$

Theorem 2.1 and Lemma 2.2 together imply the uniqueness of Theorem A. Before proving the lemma we must establish a simple and well-known fact.

### Lemma 2.3

*Suppose  $H$  is a subgroup of finite index in the group  $G$ . Suppose  $\tau$  is a representation of  $G$ ,  $\sigma$  a representation of  $H$ , and  $\rho$  the restriction of  $\tau$  to  $H$ . Then*

$$\tau \otimes \text{Ind}(G, H, \sigma) \simeq \text{Ind}(G, H, \rho \otimes \sigma).$$

Let  $\tau$  act on  $V$  and  $\sigma$  on  $W$ . Then  $\text{Ind}(G, H, \sigma)$  acts on  $X$ , the space of all functions  $f$  on  $G$  with values in  $W$  satisfying

$$f(hg) = \sigma(h) f(g)$$

while  $\text{Ind}(G, H, \rho \otimes \sigma)$  acts on  $Y$ , the space of all functions  $f$  on  $G$  with values in  $V \otimes W$  satisfying

$$f(hg) = (\rho(h) \otimes \sigma(h)) f(g).$$

Clearly,  $V \otimes X$  and  $Y$  have the same dimension. The map of  $V \otimes X$  to  $Y$  which sends  $v \otimes f$  to the function

$$f'(g) = \tau(g)v \otimes f(g)$$

is  $G$ -invariant. If it were not an isomorphism there would be a basis  $v_1, \dots, v_n$  of  $V$  and functions  $f_1, \dots, f_n$  which are not all zero such that

$$\sum_{i=1}^n \tau(g)v_i \otimes f_i(g) \equiv 0.$$

This is clearly impossible.

To prove Lemma 2.2 we take the group  $G$  of Brauer's theorem to be  $\mathfrak{G}(K/F)$ . Let  $F_i$  be the fixed field of  $N_i$  and let  $\rho_i$  be the tensor product of  $\chi_i$ , which we may regard as a representation of  $W_{K/F_i}$  and the restriction of  $\rho$  to  $W_{K/F_i}$ . Then

$$\rho \simeq \rho \otimes 1 \simeq \bigoplus_{i=1}^m n_i \text{Ind}(W_{K/F_i}, \rho_i).$$

This together with the transitivity of the induction process shows that in proving the lemma we may suppose that  $\mathfrak{G}(K/F)$  is nilpotent.

We prove the lemma, with this extra condition, by induction on  $[K : F]$ . We use the symbol  $\omega$  to denote an orbit in the set of quasi-characters of  $C_K$  under the action of  $\mathfrak{G}(K/F)$ . The restriction of  $\rho$  to  $C_K$  is the direct sum of one-dimensional representations. If  $\rho$  acts on  $V$  let  $V_\omega$  be the space spanned by the vectors transforming under  $C_K$  according to a quasi-character in  $\omega$ .  $V$  is the direct sum of the spaces  $V_\omega$  which are each invariant under  $W_{K/F}$ . For our purposes we may suppose that  $V = V_\omega$  for some  $\omega$ . Choose  $\chi_K$  in this  $\omega$  and let  $V_0$  be the space of vectors transforming under  $C_K$  according to  $\chi_K$ . Let  $E$  be the fixed field of the isotropy group of  $\chi_K$ .  $V_0$  is invariant under  $W_{K/E}$ . Let  $\sigma$  be the representation of  $W_{K/E}$  in  $V_0$ . It is well-known that

$$\rho \simeq \text{Ind}(W_{K/F}, W_{K/E}, \sigma).$$

To see this one has only to verify that the space  $X$  on which the representation on the right acts and  $V$  have the same dimension and that the map

$$f \longrightarrow \sum_{W_{K/E} \backslash W_{K/F}} \rho(g^{-1})f(g)$$

of  $X$  into  $V$  which is clearly  $W_{K/F}$ -invariant has no kernel. It is easy enough to do this.

If  $E \neq F$  the assertion of the lemma follows by induction. If  $E = F$  choose  $L$  containing  $F$  so that  $K/L$  is cyclic of prime degree and  $L/F$  is Galois. Then  $\rho(W_{K/L})$  is an abelian group and  $W_{K/L}^c$  is contained in the kernel of  $\rho$ . Thus  $\rho$  may be regarded as a representation of  $W_{L/F}$ .

The assertion now follows from the induction assumption and the concluding remarks of the previous paragraph.

Now take a local field  $E$  and a representation  $\rho$  of  $W_{K/E}$ . Choose intermediate fields  $E_1, \dots, E_m$ , one-dimensional representations  $\chi_{E_i}$  of  $W_{K/E_i}$ , and integers  $n_1, \dots, n_m$  so that

$$\rho \simeq \bigoplus_{i=1}^m n_i \operatorname{Ind}(W_{K/E}, W_{K/E_i}, \chi_{E_i}).$$

If  $\omega$  is the class of  $\rho$  set

$$\varepsilon(\omega, \psi_E) = \prod_{i=1}^m \{\Delta(\chi_{E_i}, \Psi_{E_i/E}) \lambda(E_i/E, \Psi_E)\}^{n_i}.$$

Theorem 2.1 shows that the right side is independent of the way in which  $\rho$  is written as a sum of induced representations. The first and second conditions of Theorem A are clearly satisfied. If  $\rho$  is the representation above and  $\sigma$  the representation

$$\operatorname{Ind}(W_{K/F}, W_{K/E}, \rho)$$

then

$$\sigma \simeq \bigoplus_{i=1}^m n_i \operatorname{Ind}(W_{K/F}, W_{K/E_i}, \chi_{E_i}).$$

Thus if  $\omega'$  is the class of  $\sigma$

$$\varepsilon(\omega', \psi_F) = \prod_{i=1}^m \{\Delta(\chi_{E_i}, \psi_{E_i/F}) \lambda(E_i/F, \psi_F)\}^{n_i}$$

while

$$\varepsilon(\omega, \psi_{E/F}) = \prod_{i=1}^m \{\Delta(\chi_{E_i}, \psi_{E_i/F}) \lambda(E_i/E, \psi_{E/F})\}^{n_i}.$$

The third property follows from the relations

$$\dim \omega = \sum_{i=1}^m n_i [E_i : E]$$

and

$$\lambda(E_i/F, \psi_F) = \lambda(E_i/E, \psi_{E/F}) \lambda(E/F, \psi_F)^{[E_i:E]}$$

## Chapter Three.

### The Lemmas of Induction

In this paragraph we prove two simple but very useful lemmas.

#### Lemma 3.1

*Suppose  $K$  is a Galois extension of the local field  $F$ . Suppose the subset  $\mathfrak{A}$  of  $\mathcal{P}(K/F)$  has the following four properties.*

- (i) *For all  $E$ , with  $F \subseteq E \subseteq K$ ,  $E/E \in \mathfrak{A}$ .*
- (ii) *If  $E''/E'$  and  $E'/E$  belong to  $\mathfrak{A}$  so does  $E''/E$ .*
- (iii) *If  $L/E$  belongs to  $\mathcal{P}(K/F)$  and  $L/E$  is cyclic of prime degree then  $L/E$  belongs to  $\mathfrak{A}$ .*
- (iv) *Suppose that  $L/E$  in  $\mathcal{P}(K/F)$  is a Galois extension. Let  $G = \mathfrak{G}(L/E)$ . Suppose  $G = H \cdot C$  where  $H \neq \{1\}$ ,  $H \cap C = \{1\}$ , and  $C$  is a non-trivial abelian normal subgroup of  $G$  which is contained in every non-trivial normal subgroup of  $G$ . If  $E'$  is the fixed field of  $H$  and if every  $E''/E$  in  $\mathcal{P}_o(L/E)$  for which  $[E'' : E] < [E' : E]$  is in  $\mathfrak{A}$  so is  $E'/E$ . Then  $\mathfrak{A}$  is all of  $\mathcal{P}(K/F)$ .*

It is convenient to prove another lemma first.

#### Lemma 3.2

*Suppose  $K$  is a Galois extension of the local field  $F$  and  $F \subsetneq E \subseteq K$ . Suppose that the only normal subfield of  $K$  containing  $E$  is  $K$  itself and that there are no fields between  $F$  and  $E$ . Let  $G = \mathfrak{G}(K/F)$  and let  $E$  be the fixed field of  $H$ . Let  $C$  be a minimal non-trivial abelian normal subgroup of  $G$ . Then  $G = HC$ ,  $H \cap C = \{1\}$  and  $C$  is contained in every non-trivial normal subgroup of  $G$ . In particular if  $H = \{1\}$ ,  $G = C$  is abelian of prime order.*

$H$  is contained in no subgroup besides itself and  $G$  contains no normal subgroup but  $\{1\}$ . Thus if  $H$  is normal it is  $\{1\}$  and  $G$  has no proper subgroups and is consequently cyclic of prime order. Suppose  $H$  is not normal. Since  $G$  is solvable it does contain a minimal non-trivial abelian normal subgroup  $C$ . Since  $C$  is not contained in  $H$ ,  $H \subsetneq HC$  and  $G = HC$ . Since  $H \cap C$  is a normal subgroup of  $G$  it is  $\{1\}$ . If  $D$  is a non-trivial normal subgroup of  $G$  which does not contain  $C$  then  $D \cap C = \{1\}$  and  $D$  is contained in the centralizer  $Z$  of  $C$ . Then  $DC$  is also and  $Z$  must meet  $H$  non-trivially. But  $Z \cap H$  is a normal subgroup of  $G$ . This is a contradiction and the lemma is proved.

The first lemma is certainly true if  $[K : F] = 1$ . Suppose  $[K : F] > 1$  and the lemma is valid for all pairs  $[K' : F']$  with  $[K' : F'] < [K : F]$ . If the Galois extension  $L/E$  belongs to  $\mathcal{P}(K/F)$  then  $\mathfrak{A} \cap \mathcal{P}(L/E)$  satisfies the condition of the lemma with  $K$  replaced by  $L$  and  $F$  by  $E$ . Thus, by induction, if  $[L : E] < [K : F]$ ,  $\mathcal{P}(L/E) \subseteq \mathfrak{A}$ . In particular if  $E'/E$  is not in  $\mathfrak{G}$  then  $E = F$  and the only normal subfield of  $K$  containing  $E'$  is  $K$  itself. If  $\mathfrak{A}$  is not  $\mathcal{P}(K/F)$  then amongst all extensions which are not in  $\mathfrak{G}$  choose one  $E/F$  for which  $[E : F]$  is minimal. Because of (ii) there are no fields between  $F$  and  $E$ . Lemma 3.2, together with (iii) and (iv), show that  $E/F$  is in  $\mathfrak{A}$ . This is a contradiction.

There is a variant of Lemma 3.1 which we shall have occasion to use.

### Lemma 3.3

*Suppose  $K$  is a Galois extension of the local field  $F$ . Suppose the subset  $\mathfrak{A}$  of  $\mathcal{P}_o(K/F)$  has the following properties.*

- (i)  $F/F \in \mathfrak{A}$ .
- (ii) If  $L/F$  is normal and  $L \subsetneq K$  then  $\mathcal{P}_o(L/F) \subseteq \mathfrak{A}$ .
- (iii) If  $F \subset E \subseteq E' \subseteq K$  and  $E/F$  belong to  $\mathfrak{G}$  then  $E'/F$  belong to  $\mathfrak{A}$ .
- (iv) If  $L/F$  in  $\mathcal{P}_o(K/F)$  is cyclic of prime degree then  $L/F \in \mathfrak{A}$ .
- (v) Suppose that  $L/F$  in  $\mathcal{P}_o(K/F)$  is Galois and  $G = \mathfrak{G}(L/F)$ . Suppose  $G = HC$  where  $H \neq \{1\}$ ,  $H \cap C = \{1\}$ , and  $C$  is a non-trivial abelian normal subgroup of  $G$  which is contained in every non-trivial normal subgroup. If  $E$  is the fixed field of  $H$  and if every  $E'/F$  in  $\mathcal{P}_o(L/F)$  for which  $[E' : F] < [E : F]$  is in  $\mathfrak{A}$  so is  $E/F$ .

Then  $\mathfrak{A}$  is  $\mathcal{P}_o(K/F)$ .

Again if  $\mathfrak{A}$  is not  $\mathcal{P}_o(K/F)$  there is an  $E/F$  not in  $\mathfrak{A}$  for which  $[E : F]$  is minimal. Certainly  $[E : F] > 1$ . By (ii) and (iii),  $E$  is contained in no proper normal subfield of  $K$  and there are no fields between  $E$  and  $F$ . Lemma 3.2 together with (iv) and (v) lead to the contradiction that  $E/F$  is in  $\mathfrak{A}$ .

## Chapter Four.

### The Lemma of Uniqueness

Suppose  $K/F$  is a finite Galois extension of the local field  $F$  and  $\psi_F$  is a non-trivial additive character of  $F$ . A function  $E/F \rightarrow \lambda(E/F, \psi_F)$  on  $\mathcal{P}_\circ(K/F)$  will be called a weak  $\lambda$ -function if the following two conditions are satisfied.

- (i)  $\lambda(F/F, \Psi_F) = 1$ .
- (ii) If  $E_1, \dots, E_r, E'_1, \dots, E'_s$  are fields lying between  $F$  and  $K$ , if  $\mu_i, 1 \leq i \leq r$ , is a one-dimensional representation of  $\mathfrak{G}(K/E_i)$ , if  $\nu_j, 1 \leq j \leq s$ , is a one-dimensional representation of  $\mathfrak{G}(K/E'_j)$ , and if

$$\bigoplus_{i=1}^r \text{Ind}(\mathfrak{G}(K/F), \mathfrak{G}(K/E_i), \mu_i)$$

is equivalent to

$$\bigoplus_{j=1}^s \text{Ind}(\mathfrak{G}(K/F), \mathfrak{G}(K/E'_j), \nu_j)$$

then

$$\prod_{i=1}^r \Delta(\chi_{E_i}, \psi_{E_i/F}) \lambda(E_i/F, \psi_F)$$

is equal to

$$\prod_{j=1}^s \Delta(\chi_{E'_j}, \psi_{E'_j/F}) \lambda(E'_j/F, \psi_F)$$

if  $\chi_{E_i}$  is the character of  $C_{E_i}$  corresponding to  $\mu_i$  and  $\chi_{E'_j}$  is the character of  $C_{E'_j}$  corresponding to  $\nu_j$ .

Supposing that a weak  $\lambda$ -function is given on  $\mathcal{P}_\circ(K/F)$ , we shall establish some of its properties.

#### Lemma 4.1

- (i) If  $L/F$  in  $\mathcal{P}_\circ(K/F)$  is normal the restriction of  $\lambda(\cdot, \psi_F)$  to  $\mathcal{P}_\circ(L/F)$  is a weak  $\lambda$ -function.
- (ii) If  $E/F$  belongs to  $\mathcal{P}_\circ(K/F)$  and  $\lambda(E/F, \psi_F) \neq 0$  the function on  $\mathcal{P}_\circ(K/E)$  defined by

$$\lambda(E'/E, \psi_{E/F}) = \lambda(E'/F, \psi_F) \lambda(E/F, \psi_F)^{-[E':E]}$$

is a weak  $\lambda$ -function.

Any one-dimensional representation  $\mu$  of  $\mathfrak{G}(L/E)$  may be inflated to a one-dimensional representation, again called  $\mu$ , of  $\mathfrak{G}(K/E)$  and

$$\text{Ind}(\mathfrak{G}(K/F), \mathfrak{G}(K/E), \mu)$$

is just the inflation to  $\mathfrak{G}(K/F)$  of

$$\text{Ind}(\mathfrak{G}(L/F), \mathfrak{G}(L/E), \mu).$$

The first part of the lemma follows immediately from this observation.

As for the second part, the relation

$$\lambda(E/E, \psi_{E/F}) = 1$$

is clear. If fields  $E_i$ ,  $1 \leq i \leq r$ ,  $E'_j$ ,  $1 \leq j \leq s$ , lying between  $E$  and  $K$  and representations  $\mu_i$  and  $\nu_j$  are given as prescribed and if

$$\bigoplus_{i=1}^r \text{Ind}(\mathfrak{G}(K/E), \mathfrak{G}(K/E_i), \mu_i) = \rho$$

is equivalent to

$$\bigoplus_{j=1}^s \text{Ind}(\mathfrak{G}(K/E), \mathfrak{G}(K/E'_j), \nu_j) = \sigma$$

then

$$\bigoplus_{i=1}^r \text{Ind}(\mathfrak{G}(K/F), \mathfrak{G}(K/E_i), \mu_i)$$

is equivalent to

$$\bigoplus_{j=1}^s \text{Ind}(\mathfrak{G}(K/F), \mathfrak{G}(K/E'_j), \nu_j)$$

so that

$$\prod_{i=1}^r \Delta(\chi_{E_i}, \psi_{E_i/F}) \lambda(E_1/F, \psi_F) \tag{A}$$

is equal to

$$\prod_{j=1}^s \Delta(\chi_{E'_j}, \psi_{E'_j/F}) \lambda(E'_j/F, \psi_F). \tag{B}$$

Since  $\rho$  and  $\sigma$  have the same dimension

$$\sum_{i=1}^r [E_i : E] = \sum_{j=1}^s [E'_j : E]$$

so that

$$\prod_{i=1}^r \lambda(E/F, \psi_F)^{[E_i:E]} = \prod_{j=1}^s \lambda(E/F, \psi_F)^{[E'_j:F]}.$$

Dividing (A) by the left side of this equation and (B) by the right and observing that the results are equal we obtain the relation needed to prove the lemma.

If  $K/F$  is abelian  $S(K/F)$  will be the set of characters of  $C_F$  which are 1 on  $N_{K/F}C_K$ .

#### Lemma 4.2

If  $K/F$  is abelian

$$\lambda(K/F, \Psi_F) = \prod_{\mu_F \in S(K/F)} \Delta(\mu_F, \psi_F).$$

$\mu_F$  determines a one-dimensional representation of  $\mathfrak{G}(K/F)$  which we also denote by  $\mu_F$ . The lemma is an immediate consequence of the equivalence of

$$\text{Ind}(\mathfrak{G}(K/F), \mathfrak{G}(K/K), 1)$$

and

$$\bigoplus_{\mu_F \in S(K/F)} \text{Ind}(\mathfrak{G}(K/F), \mathfrak{G}(K/F), \mu_F).$$

#### Lemma 4.3

Suppose  $K/F$  is normal and  $G = \mathfrak{G}(K/F)$ . Suppose  $G = HC$  where  $H \cap C = \{1\}$  and  $C$  is a non-trivial abelian normal subgroup. Let  $E$  be the fixed field of  $H$  and  $L$  that of  $C$ . Let  $T$  be a set of representatives of the orbits of  $S(K/L)$  under the action of  $G$ . If  $\mu \in T$  let  $B_\mu$  be the isotropy group of  $\mu$  and let  $B_\mu = \mathfrak{G}(K/L_\mu)$ . Then  $[L_\mu : F] < [E : F]$  and

$$\lambda(E/F, \psi_F) = \prod_{\mu \in T} \Delta(\mu', \psi_{L_\mu/F}) \lambda(L_\mu/F, \psi_F).$$

Here  $\mathfrak{G}(K/L_\mu) = \mathfrak{G}(K/L) \cdot (\mathfrak{G}(K/L_\mu) \cap \mathfrak{G}(K/E))$  and  $\mu'$  is the character of  $C_{L_\mu}$  associated to the character of  $\mathfrak{G}(K/L_\mu) : g \longrightarrow \mu(g_1)$  if

$$g = g_1 g_2, \quad g_1 \in \mathfrak{G}(K/L), \quad g_2 \in \mathfrak{G}(K/L_\mu) \cap \mathfrak{G}(K/E),$$

We may as well denote the given character of  $\mathfrak{G}(K/L_\mu)$  by  $\mu'$  also. To prove the lemma we show that

$$\text{Ind}(\mathfrak{G}(K/F), \mathfrak{G}(K/E), 1) = \sigma$$

is equivalent to

$$\bigoplus_{\mu \in T} \text{Ind}(\mathfrak{G}(K/F), \mathfrak{G}(K/L_\mu), \mu').$$

Since  $T$  has at least two elements it will follow that

$$[E : F] = \dim \text{Ind}(\mathfrak{G}(K/F), \mathfrak{G}(K/E), 1)$$

is greater than

$$[L_\mu : F] = \dim \text{Ind}(\mathfrak{G}(K/F), \mathfrak{G}(K/L_\mu), \mu').$$

The representation  $\sigma$  acts on the space of functions on  $H \backslash G$ . If  $\nu \in S(K/L)$ , that is, is a character of  $C$ , let  $\psi_\nu(hc) = \nu(c)$  if  $h \in H$ ,  $c \in C$ . The set

$$\{\psi_\nu \mid \nu \in S(K/L)\}$$

is a basis for the functions on  $H \backslash G$ . If  $\mu \in T$  let  $S_\mu$  be its orbit; then

$$V_\mu = \sum_{\nu \in S_\mu} \mathbb{C} \psi_\nu$$

is invariant and irreducible under  $G$ . Moreover, if  $g$  belongs to  $\mathfrak{G}(K/L_\mu)$

$$\sigma(g)\psi_\mu = \mu'(g)\psi_\mu.$$

Since

$$\dim V_\mu = [\mathfrak{G}(K/F), \mathfrak{G}(K/L_\mu)]$$

the Frobenius reciprocity theorem implies that the restriction of  $\sigma$  to  $V_\mu$  is equivalent to

$$\text{Ind}(\mathfrak{G}(K/F), \mathfrak{G}(K/L_\mu), \mu').$$

Lemma 4.2 is of course a special case of Lemma 4.3.

#### Lemma 4.4

$\lambda(E/F, \Psi_F)$  is different from 0 for all  $E/F$  in  $\mathcal{P}_o(K/F)$ .

The lemma is clear if  $[K : F] = 1$ . We prove it by induction on  $[K : F]$ . Let  $\mathfrak{G}$  be the set of  $E/F$  in  $\mathcal{P}_o(K/F)$  for which  $\lambda(E/F, \psi_F) \neq 0$ . We may apply Lemma 3.3. The first condition of that lemma is clearly satisfied. The second follows from the induction assumption and the first part of Lemma 4.1; the third from the induction assumption and the second part of Lemma 4.1. The fourth and fifth follow from Lemmas 4.2 and 4.3 respectively. We of course use the fact that  $\Delta(\chi_E, \Psi_E)$ , which is basically a Gaussian sum when  $E$  is non-archimedean, is never zero.

For every  $E'/E$  in  $\mathcal{P}(K/F)$  we can define  $\lambda(E'/E, \psi_{E/F})$  to be

$$\lambda(E'/F, \psi_F) \lambda(E/F, \psi_F)^{-[E':E]}.$$

**Lemma 4.5**

If  $E''/E'$  and  $E'/E$  belong to  $\mathcal{P}(K/F)$  then

$$\lambda(E''/E, \psi_{E/F}) = \lambda(E''/E', \psi_{E'/F}) \lambda(E'/E, \psi_{E/F})^{E'' : E'}.$$

Indeed

$$\lambda(E''/E, \psi_{E/F}) = \lambda(E''/F, \psi_F) \lambda(E/F, \psi_F)^{-[E'':E]}$$

which equals

$$\{ \lambda(E''/F, \psi_F) \lambda(E'/F, \psi_F)^{-[E'':E']} \} \{ \lambda(E'/F, \psi_F)^{[E'':E']} \lambda(E/F, \psi_F)^{-[E'':E]} \}$$

and this in turn equals

$$\lambda(E''/E', \psi_{E'/F}) \lambda(E'/E, \psi_{E/F})^{[E'':E']}.$$

**Lemma 4.6**

If  $\lambda_1(\cdot, \Psi_F)$  and  $\lambda_2(\cdot, \Psi_F)$  are two weak  $\lambda$ -functions on  $\mathcal{P}_\circ(K/F)$  then

$$\lambda_1(E'/E, \psi_{E/F}) = \lambda_2(E'/E, \psi_{E/F})$$

for all  $E'/E$  in  $\mathcal{P}(K/F)$ .

We apply Lemma 3.1 to the collection  $\mathfrak{G}$  of all pairs  $E'/E$  in  $\mathcal{P}(K/F)$  for which the equality is valid. The first condition of that lemma is clearly satisfied. The second is a consequence of the previous lemma. The third and fourth are consequences of Lemmas 4.2 and 4.3 respectively.

Since a  $\lambda$ -function is also a weak  $\lambda$ -function the uniqueness of Theorem 2.1 is now proved.

## Chapter Five.

### A Property of $\lambda$ -Functions

It follows immediately from the definition that if  $\psi'_E(x) = \psi_E(\beta x)$  then

$$\Delta(\chi_E, \psi'_E) = \chi_E(\beta) \Delta(\chi_E, \psi_E).$$

Associated to any equivalence class  $\omega$  of representations of the Weil group of the field  $F$  is a one-dimensional representation or, what is the same, a quasi-character of  $C_F$ . It is denoted  $\det \omega$  and is obtained by taking the determinant of any representation in  $\omega$ . Suppose  $\rho$  is in the class  $\omega$  and  $\rho$  is a representation of  $W_{K/F}$ . To find the value of the quasi-character  $\det \omega$  at  $\beta$  choose  $w$  in  $W_{K/F}$  so that  $\tau_{K/F} w = \beta$ . Then calculate  $\det(\rho(w))$  which equals  $\det \omega(\beta)$ .

If  $F \subseteq E \subseteq K$  the map  $\tau = \tau_{K/F}$  can be effected in two stages. We first transfer  $W_{K/F}/W_{K/F}^c$  into  $W_{K/E}/W_{K/E}^c$ ; then we transfer  $W_{K/E}/W_{K/E}^c$  into  $C_K$ . If  $W_{K/F}$  is the disjoint union

$$\bigcup_{i=1}^r W_{K/E} w_i$$

and if  $w_i w = u_i(w) w_j(i)$  then the transfer of  $w$  in  $W_{K/E}/W_{K/E}^c$  is the coset to which  $w' = \prod_{i=1}^r u_i(w)$  belongs.

Suppose  $\sigma$  is a representation of  $W_{K/E}$  and

$$\rho = \text{Ind}(W_{K/F}, W_{K/E}, \sigma).$$

$\rho$  acts on a certain space  $V$  of functions on  $W_{K/F}$  and if  $V_i$  is the collection of functions in  $V$  which vanish outside of  $W_{K/E} w_i$  then

$$V = \bigoplus_{i=1}^r V_i.$$

We decompose the matrix of  $\rho(w)$  into corresponding blocks  $\rho_{ji}(w)$ .  $\rho_{ji}(w)$  is 0 unless  $j = j(i)$  when  $\rho_{ji}(w) = \sigma(u_i(w))$ . This makes it clear that if  $\iota_{E/F}$  is the representation of  $W_{K/F}$  induced from the trivial representation of  $W_{K/E}$

$$\det(\rho(w)) = \det(\iota_{E/F}(w))^{\dim \sigma} \det(\sigma(w'))$$

or, if  $\theta$  is the class of  $\sigma$ ,

$$\det \omega(\beta) = \{\det \iota_{E/F}(\beta)\}^{\dim \theta} \{\det \theta(\beta)\}.$$

**Lemma 5.1**

Suppose  $F$  is a local field and  $E/F \longrightarrow \lambda(E/F, \psi_F)$  and  $\omega \longrightarrow \varepsilon(\omega, \psi_{E/F})$  satisfy the conditions of Theorem A for the character  $\psi_F$ . Let  $\psi'_F(x) = \psi_F(\beta x)$  with  $\beta$  in  $C_F$ . If  $E/F \longrightarrow \lambda(E/F, \psi'_F)$  and  $\omega \longrightarrow \varepsilon(\omega, \psi'_{E/F})$  satisfy the conditions of Theorem A for  $\psi'_F$  then

$$\lambda(E/F, \psi'_F) = \det \iota_{E/F}(\beta) \lambda(E/F, \psi_F)$$

and

$$\varepsilon(\omega, \psi'_{E/F}) = \det \omega(\beta) \varepsilon(\omega, \psi_{E/F}).$$

Because of the uniqueness all one has to do is verify that the expressions on the right satisfy the conditions of the theorem for the character  $\psi'_F$ . This can now be done immediately.

## Chapter Six.

### A Filtration of the Weil Group

In this paragraph I want to reformulate various facts found in Serre's book [12] as assertions about a filtration of the Weil group. Although some of the lemmas to follow will be used to prove the four main lemmas, the introduction of the filtration itself is not really necessary. It serves merely to unite in a form which is easily remembered the separate lemmas of which we will actually be in need.

Let  $K$  be a finite Galois extension of the non-archimedean local field  $F$  and let  $G = \mathfrak{G}(K/F)$ . Let  $O_F$  be the ring of integers in  $F$  and let  $\mathfrak{p}_F$  be the maximal ideal of  $O_F$ . If  $i \geq -1$  is an integer let  $G_i$  be the subgroup of  $G$  consisting of those elements which act trivially on  $O_F/\mathfrak{p}_F^{i+1}$ . If  $u \geq -1$  is a real number and  $i$  is the smallest integer greater than or equal to  $u$  set  $G_u = G_i$ . Finally if  $u \geq -1$  set

$$\varphi_{K/F}(u) = \int_0^u \frac{1}{[G_0 : G_t]} dt.$$

The integrand is not defined at -1 but that is of no consequence.  $\varphi_{K/F}$  is clearly a piecewise linear, continuous, and increasing map of  $[-1, \infty)$  onto itself. The inverse function\*  $\psi_{K/F}$  will have the same properties.

We take from Serre's book the following lemma.

#### Lemma 6.1

If  $F \subseteq L \subseteq K$  and  $L/F$  is normal then  $\varphi_{K/F} = \varphi_{L/F} \circ \varphi_{K/L}$  and  $\psi_{K/F} = \psi_{K/L} \circ \psi_{L/F}$ .

The circle denotes composition not multiplication. This lemma allows us to define  $\varphi_{E/F}$  and  $\psi_{E/F}$  for any finite separable extension  $E/F$  by choosing a Galois extension  $L$  of  $F$  which contains  $E$  and setting

$$\varphi_{E/F} = \varphi_{L/F} \circ \psi_{L/E}$$

$$\psi_{E/F} = \varphi_{L/E} \circ \psi_{L/F}$$

---

\* In this chapter  $\psi_{K/F}$  does not appear as an additive character. Nonetheless, there is a regrettable conflict of notation.

because if  $L'$  is another such extension we can choose a Galois extension  $K$  containing both  $L$  and  $L'$  and

$$\begin{aligned}\varphi_{L/F} \circ \psi_{L/E} &= \varphi_{L/F} \circ \varphi_{K/L} \circ \psi_{K/L} \circ \psi_{L/E} = \varphi_{K/F} \circ \psi_{K/E} = \varphi_{L'/F} \circ \psi_{L'/E} \\ \varphi_{L/E} \circ \psi_{L/F} &= \varphi_{L/E} \circ \varphi_{K/L} \circ \psi_{K/L} \circ \psi_{L/F} = \varphi_{K/E} \circ \psi_{K/F} = \varphi_{L'/E} \circ \psi_{L'/F}.\end{aligned}$$

Of course  $\psi_{E/F}$  is the inverse of  $\varphi_{E/F}$ .

**Lemma 6.2**

*If  $E \subseteq E' \subseteq E''$  and  $E''/E$  is finite and separable,  $\varphi_{E''/E} = \varphi_{E'/E} \circ \varphi_{E''/E'}$  and  $\psi_{E''/E} = \psi_{E''/E'} \circ \psi_{E'/E}$ .*

Each of these relations can be obtained from the other by taking inverses; we verify the second

$$\psi_{E''/E'} \circ \psi_{E'/E} = \varphi_{L/E''} \circ \psi_{L/E'} \circ \varphi_{L/E'} \circ \psi_{L/E} = \varphi_{L/E''} \circ \psi_{L/E} = \psi_{E''/E}.$$

It will be necessary for us to know the values of these functions in a few special cases.

**Lemma 6.3**

- (i) *If  $K/F$  is Galois and unramified  $\psi_{K|F}(u) \equiv u$ .*
- (ii) *If  $K/F$  is cyclic of prime degree  $\ell$  and if  $G = G_t$  while  $G_{t+1} = \{1\}$  where  $t$  is a non-negative integer then*

$$\begin{aligned}\psi_{K/F}(u) &= u & u \leq t \\ &= t + \ell(u - t) & u \geq t.\end{aligned}$$

These assertions follow immediately from the definitions.

**Lemma 6.4**

*Suppose  $K/F$  is Galois and  $G = \mathfrak{G}(K/F)$  is a product  $HC$  where  $H \neq \{1\}$ ,  $H \cap C = \{1\}$ , and  $C$  is a non-trivial abelian normal subgroup of  $G$  which is contained in every non-trivial normal subgroup.*

- (i) *If  $K/F$  is tamely ramified so that  $G_1 = \{1\}$  then  $G_0 = C$  is a cyclic group of prime order  $\ell$  and  $[G : G_0] = [H : 1]$  divides  $\ell - 1$ . If  $E$  is the fixed field of  $H$ ,  $\psi_{E/F}(u) = u$  for  $u \leq 0$  and  $\psi_{E/F}(u) = \ell u$  for  $u \geq 0$ .*

- (ii) If  $K/F$  is wildly ramified there is an integer  $t \geq 1$  such that  $C = G_1 = \dots = G_t$  while  $G_{t+1} = \{1\}$ .  $[G_0 : G_1]$  divides  $[G_1 : 1] - 1$  and every element of  $C$  has order  $p$  or 1. If  $E$  is the fixed field of  $H$  and  $L$  that of  $C$

$$\begin{aligned}\psi_{L/F}(u) &= u & u \leq 0 \\ &= [G_0 : G_1]u & u \geq 0\end{aligned}$$

while

$$\begin{aligned}\psi_{E/F}(u) &= u & u \leq \frac{t}{[G_0 : G_1]} \\ &= \frac{t}{[G_0 : G_1]} + [G_1 : 1] \left( u - \frac{t}{[G_0 : G_1]} \right) & u \geq \frac{t}{[G_0 : G_1]}\end{aligned}$$

We observed in the third paragraph that  $C$  must be its own centralizer.  $G_0$  cannot be  $\{1\}$ . Thus  $C \subseteq G_0$ . In case (i)  $G_0$  is abelian and thus  $G_0 = C$ . In both cases if  $\ell$  is a prime dividing the order of  $C$  the set of elements in  $C$  of order  $\ell$  or 1 is a non-trivial normal subgroup of  $G$  and thus  $C$  itself. In case (i)  $C$  is cyclic and thus of prime order  $\ell$ . Moreover,  $H$  which is isomorphic to  $G/G_0$  is abelian and, if  $h \in H$ ,  $\{c \in C | hc = ch\}$  is a normal subgroup of  $G$  and hence  $\{1\}$  or  $C$ . If  $h \neq 1$  it must be 1. Consequently each orbit of  $H$  in  $C - \{1\}$  has  $[H : 1]$  elements and  $[H : 1]$  divides  $\ell - 1$ .

In case (ii)  $G_1$  is a non-trivial normal subgroup and hence contains  $C$ .  $G_1$  and  $C$  are both  $p$ -groups. The centralizer of  $G_1$  in  $C$  is not trivial. As a normal subgroup of  $G$  it contains  $C$ . Therefore it is  $C$  and  $G_1$  is contained in  $C$  which is its own centralizer. Since each  $G_i$ ,  $i \geq 1$ , is a normal subgroup of  $G$ , it is either  $C$  or  $\{1\}$ . Thus there is an integer  $t \geq 1$  such that  $G_1 = G_t = C$  while  $G_{t+1} = \{1\}$ . If  $i \geq 0$  is an integer let  $U_K^i$  be the group of units of  $O_K$  which are congruent to 1 modulo  $p_K^{i+1}$ ; let  $U_K^{(-1)} = C_K$ , and if  $U \geq -1$  is any real number let  $i$  be the smallest integer greater than or equal to  $U$  and set  $U_K^U = U_K^i$ . If  $\theta_t$  is the map of  $G_t/G_{t+1}$  into  $p_K^t/p_K^{t+1}$  and  $\theta_0$  the map of  $G_0/G_1$  into  $U_K^0/U_K^1$  introduced in Serre then, for  $g$  in  $G_0$  and  $h$  in  $C$ ,

$$\theta_t(ghg^{-1}) = \theta_0(g)^t \Theta_t(h).$$

If  $h \neq 1$ ,  $ghg^{-1} = h$  if and only if  $\theta_0(g)^t = 1$  and then  $g$  belongs to the centralizer of  $C$ , that is to  $G_1$ . Again  $C - \{1\}$  is broken up into orbits, each with  $[G_0 : G_1]$  elements and  $[G_0 : G_1]$  divides  $[G_i : 1] - 1$ . Observe that  $t$  must be prime to  $[G_0 : G_1]$ .

It follows immediately from the definitions that  $H_u = H \cap G_u$ . In case (i)  $H_0$  will be  $\{1\}$  and  $\varphi_{K/E}(u)$  will be identically  $u$ . Thus  $\psi_{E/F} = \psi_{K/F}$  and, from the definition,  $\psi_{K/F}(u) = u$  if  $u \leq 0$  while  $\psi_{K/F}(u) = [G_0 : 1]u$  if  $u \geq 0$ . In case (ii),  $\varphi_{K/E}(u) = u$  if  $u \leq 0$  and

$$\varphi_{K/E}(u) = \frac{u}{[H_0 : 1]} = \frac{u}{[G_0 : G_1]}$$

if  $u \geq 0$  while  $\psi_{K/F}(u) = u$  if  $u \leq 0$  and

$$\begin{aligned} \psi_{K/F}(u) &= [G_0 : G_1]u & 0 \leq u \leq \frac{t}{[G_0 : G_1]} \\ &= t + [G_0 : 1] \left( u - \frac{t}{[G_0 : G_1]} \right) & \frac{t}{[G_0 : G_1]} \leq u. \end{aligned}$$

The lemma follows.

### Lemma 6.5

*For every separable extension  $E'/E$  the function  $\psi_{E'/E}$  is convex, and if  $u$  is an integer so is  $\psi_{E'/E}(u)$ .*

All we have to do is prove that the assertion is true for all  $E'/E$  in  $\mathcal{P}(K/F)$  if  $F$  is an arbitrary non-archimedean local field and  $K$  an arbitrary Galois extension of it. To do this we just combine the previous three lemmas with Lemma 3.1. We are going to use the same method to prove the following lemma.

### Lemma 6.6

*For every separable extension  $E'/E$  and any  $u \geq -1$*

$$N_{E'/E}(U_{E'}^{\psi_{E'/E}(u)}) \subseteq U_E^u.$$

We have to verify that the set  $\mathfrak{G}$  of all  $E'/E$  in  $\mathcal{P}(K/F)$  for which the assertion is true satisfies the conditions of Lemma 3.1. There is no problem with the first two.

### Lemma 6.7

*$E'/E$  belongs to  $\mathfrak{G}$  if and only if for every integer  $n \geq -1$*

$$N_{E'/E}(U_{E'}^{\psi_{E'/E}(n)}) \subseteq U_E^n$$

and

$$N_{E'/E} \left( U_{E'}^{\psi_{E'/E}(n)+1} \right) \subseteq U_E^{n+1}.$$

If  $E'/E$  belongs to  $\mathfrak{G}$  choose  $\varepsilon > 0$  so that  $\psi_{E'/E}(n + \varepsilon) = \psi_{E'/E}(n) + 1$ . The smallest integer greater than or equal to  $n + \varepsilon$  is at least  $n + 1$  so

$$N_{E'/E} \left( U_{E'}^{\psi_{E'/E}(n)+1} \right) \subseteq U_E^{n+\varepsilon} \subseteq U_E^{n+1}.$$

Conversely suppose the conditions of the lemma are satisfied and  $n < u < n + 1$ . Since  $\psi_{E'/E}(n)$  is an integer the smallest integer greater than or equal to  $\psi_{E'/E}(u)$  is at least  $\psi_{E'/E}(n) + 1$ . Thus

$$N_{E'/E} \left( U_{E'}^{\psi_{E'/E}(u)} \right) \subseteq N_{E'/E} \left( U_{E'}^{\psi_{E'/E}(n)+1} \right) \subseteq U_E^{n+1} = U_E^u.$$

### Lemma 6.8

If  $L/E$  is Galois then, for every integer  $n \geq -1$ ,

$$N_{L/E} \left( U_L^{\psi_{L/E}(n)} \right) \subseteq U_E^n$$

and

$$N_{L/E} \left( U_L^{\psi_{L/E}(n)+1} \right) \subseteq U_E^{n+1}.$$

The assertion is clear if  $n = -1$ . A proof for the case  $n \geq 0$  and  $L/E$  totally ramified is given in Serre's book. Since that proof works equally well for all  $L/E$  we take the lemma as proved.

### Lemma 6.9

Suppose  $K/F$  is Galois and  $G = \mathfrak{G}(K/F)$ . Suppose  $G = HC$  where  $H \neq \{1\}$ ,  $H \cap C = \{1\}$ , and  $C$  is a non-trivial abelian normal subgroup of  $G$  which is contained in every non-trivial normal subgroup of  $G$ . If  $E$  is the fixed field of  $H$

$$N_{E/F} \left( U_E^{\psi_{E/F}(u)} \right) \subseteq U_F^u$$

for all  $u \geq -1$ .

Let  $L$  be the fixed field of  $C$ . If  $K/F$  is tamely ramified  $K/E$  and  $L/F$  are unramified so that  $\psi_{E/F} = \psi_{K/L}$  and  $U_E^v = C_E \cap U_K^v$ ,  $U_F^v = C_F \cap U_L^v$  for every  $v \geq -1$ . If  $\alpha$  belongs to  $C_E$ , then delete  $N_{K/L}\alpha = N_{E/F}\alpha$ . Since  $K/L$  is Galois

$$N_{E/F} \left( U_E^{\psi_{E/F}(u)} \right) \subseteq C_F \cap N_{K/L} (U_L^{\psi_{K/L}(u)}) \subseteq C_F \cap U_L^u = U_F^u.$$

If  $K/F$  is not tamely ramified

$$\mathfrak{p}_E^n = E \cap p_k^{[G_0:G_1]n-m}$$

if  $n \geq 1$  and  $0 \leq m < [G_0 : G_1]$ . Thus

$$U_E^v = G_E \cap U_K^v$$

if  $-1 \leq v \leq 0$  and

$$U_E^v = C_E \cap U_K^{[G_0:G_1]v}$$

if  $v \geq 0$  or, more briefly,

$$U_E^v = C_E \cap U_K^{\psi_{K/E}(v)}$$

for all  $v \geq -1$ . In the same way we find

$$U_F^v = C_F \cap U_L^{\psi_{L/F}(v)}$$

for all  $v \geq -1$ . Since  $K/L$  is normal

$$N_{E/F} \left( U_E^{\psi_{E/F}(u)} \right) \subseteq C_F \cap N_{K/L} \left( U_K^{\psi_{K/F}(u)} \right) \subseteq C_F \cap U_L^{\psi_{L/F}(u)} = U_F^u.$$

Lemma 6.6 now follows immediately.

### Lemma 6.10

- (a) Suppose  $K/F$  is Galois and  $G = \mathfrak{G}(K/F)$ . Suppose  $t \geq -1$  is an integer such that  $G = G_t \neq G_{t+1}$ . Then  $\psi_{K/F}(u) = u$  for  $u \leq t$ . Moreover  $N_{K/F}$  defines an isomorphism of  $C_K/U_K^t$  with  $C_F/U_F^t$  and if  $-1 \leq u \leq t$  the inverse image of  $U_F^u/U_F^t$  is  $U_K^u/U_K^t$ . However the map of  $C_K/U_K^{t+1}$  into  $C_F/U_F^{t+1}$  defined by the norm is not surjective.
- (b) Suppose  $K/F$  is Galois and  $G = \mathfrak{G}(K/F)$ . Suppose  $s \geq -1$  is an integer and  $G = G_s$ . If  $F \subseteq E \subseteq K$ ,  $\psi_{E/F}(u) = u$  for  $u \leq s$  and  $N_{E/F}$  defines an isomorphism of  $C_E/U_E^s$  and  $C_F/U_F^s$ . If  $-1 \leq u \leq s$  the inverse image of  $U_F^u/U_F^s$  is  $U_E^u/U_E^s$ .

If  $t = -1$  the assertions of part (a) are clear. If  $t \geq 0$ ,  $K/F$  is totally ramified. The relation  $\psi_{K/F}(u) = u$  for  $u \leq t$  is an immediate consequence of the definition. Since the extension

is totally ramified  $N_{K/F}$  defines an isomorphism of  $U_K^{-1}/U_K^0$  and  $U_F^{-1}/U_F^0$ . It follows from Proposition V.9 of Serre's book that if  $0 \leq n < t$  the associated map  $U_K^n/U_K^{n+1} \rightarrow U_F^n/U_F^{n+1}$  is an isomorphism but that the map  $U_K^t/U_K^{t+1} \rightarrow U_F^t/U_F^{t+1}$  has a non-trivial cokernel. The first part of the lemma is an immediate consequence of these facts.

To prove part (b) we first observe that there is a  $t \geq s$  such that  $G = G_t \neq G_{t+1}$ . It then follows from part (a) that the map  $N_{K/F}$  determines an isomorphism of  $C_K/U_K^s$  and  $C_F/U_F^s$  under which  $U_K^u/U_K^s$  and  $U_F^u/U_F^s$  correspond if  $-1 \leq u \leq s$ . Let  $E$  be the fixed field of  $H$ . We have  $H_s = H \cap G_s = H$ , so that  $N_{K/E}$  determines an isomorphism of  $C_K/U_K^s$  and  $C_E/U_E^s$  under which  $U_K^u/U_K^s$  and  $U_E^u/U_E^s$  correspond if  $-1 \leq u \leq s$ . Moreover if  $u \leq s$ ,  $\psi_{K/F}(u) = \psi_{K/E}(u) = u$  so that  $\psi_{E/F}(u) = u$ . Part (b) follows from these observations and the relation  $N_{K/F} = N_{E/F}N_{K/E}$ .

If  $E$  is any non-archimedean local field and  $u > -1$

$$U_E^u = \cap_{v < u} U_E^v.$$

If  $\alpha$  belongs to  $C_E$  set

$$v_E(\alpha) = \sup\{u \mid \alpha \in U_E^u\}.$$

Then  $v_E(1) = \infty$ , but  $v_E(\alpha)$  is finite if  $\alpha \neq 1$  and  $\alpha$  belongs to  $U_E^{v_E(\alpha)}$ .

If  $F \subseteq L \subseteq K$ ,  $\tau_{K/F, L/F}$  will be any of the maps  $W_{K/F} \rightarrow W_{L/F}$  associated to the imbedding  $L/F \rightarrow K/F$ . We abbreviate  $\tau_{K/F, F/F}$  to  $\tau_{K/F}$ . If  $w$  belongs to  $W_{K/F}$ ,  $\sigma(w)$  is the image of  $w$  in  $\mathfrak{G}(K/F)$ , and  $E$  is the fixed field of  $\sigma(w)$ , we set

$$v_{K/F}(w) = \varphi_{E/F}(v_E(\tau_{K/E}(w))).$$

Note that we regard  $W_{K/E}$  as a subgroup of  $W_{K/F}$ . If  $v \geq -1$  let

$$W_{K/F}^v = \{w \mid v_{K/F}(w) \geq v\}.$$

We shall show that  $W_{K/F}^v$  is a normal subgroup of  $W_{K/F}$ . These groups provide a filtration of the Weil group, some of whose properties are established in the following lemmas.

**Lemma 6.11**

If  $\sigma \in \mathfrak{G}(K/F)$  and  $t = \sup\{u \mid \sigma \in G_u\}$ , set  $v_{K/F}(\sigma) = \varphi_{K/F}(t)$ . Then

$$v_{K/F}(\sigma) = \max\{v_{K/F}(w) \mid \sigma(w) = \sigma\}.$$

If  $\sigma = 1$  both sides are infinite and the assertion is clear. If  $\sigma \neq 1$  let  $E$  be the fixed field of  $\sigma$ . If  $\sigma(w) = \sigma$ ,  $w$  belongs to  $W_{K/E}$  and  $v_{K/F}(w) = \varphi_{E/F}(v_{K/E}(w))$ . Also  $v_{K/F}(\sigma) = \varphi_{E/F}(v_{K/E}(\sigma))$ . Consequently it is sufficient to prove the lemma when  $F = E$ . The set

$$S = \{\tau_{K/F}(w) \mid \sigma(w) = \sigma\}$$

is a coset of  $N_{K/F}(C_K)$  in  $C_F$  and  $C_F$  is generated by  $N_{K/F}(C_K)$  together with any element of  $S$ . Moreover  $s = \max\{v_F(\beta) \mid \beta \in S\}$  is the largest integer such that  $S \cap U_F^s$  is not empty. Since  $G = G_t \neq G_{t+1}$  the preceding lemma shows that  $s = t = \varphi_{K/F}(t)$ .

**Lemma 6.12**

- (a) For all  $w$  and  $w_1$  in  $W_{K/F}$ ,  $v_{K/F}(w) = v_{K/F}(w^{-1})$  and  $v_{K/F}(w_1 w w_1^{-1}) = v_{K/F}(w)$ .
- (b) If  $F \subseteq E \subseteq K$  and  $w$  belong to  $W_{K/E}$  then

$$v_{K/F}(w) = \varphi_{E/F}(v_{K/E}(w)).$$

- (c) For all  $w$  in  $W_{K/F}$ ,  $\tau_{K/F}(w) \subset U_F^{v_{K/F}(w)}$ .

The first two assertions follow immediately from the definitions and the basic properties of the Weil group. I prove only the third. Let me first observe that if  $F \subseteq E \subseteq K$  and  $w \in W_{K/E}$ , then

$$\tau_{K/F}(w) = N_{E/F}(\tau_{K/E}(w)).$$

To see this, choose a set of representatives  $w_1, \dots, w_r$  for the cosets of  $C_K$  in  $W_{K/E}$  and then a set of representatives  $v_1, \dots, v_s$  for the cosets of  $W_{K/E}$  in  $W_{K/F}$ . Let  $w_i w = a_i w_{j(i)}$  with  $a_i$  in  $C_K$ ; then

$$\tau_{K/E}(w) = \prod_{i=1}^r a_i.$$

However  $v_j w_i w = v_j a_i v_j^{-1} v_j w_{j(i)}$  so that

$$\tau_{K/F}(w) = \prod_{j=1}^s \prod_{i=1}^r v_j a_i v_j^{-1} = \prod_{j=1}^s v_j \tau_{K/E}(w) v_j^{-1} = N_{E/F}(\tau_{K/E}(w)).$$

In particular, if  $E$  is the fixed field of  $\sigma(w)$ ,  $\tau_{K/E}(w)$  is contained  $U_E^{\psi_{E/F}(v_{K/F}(w))}$  and  $\tau_{K/F}(w)$  is contained in

$$N_{E/F}(U_E^{\psi_{E/F}(v_{K/F}(w))}) \subseteq U_F^{v_{K/F}(w)}.$$

**Lemma 6.13**

If  $u$  and  $v$  belong to  $W_{K/F}$  then

$$v_{K/F}(uv) \geq \min\{v_{K/F}(u), v_{K/F}(v)\}.$$

Let  $\sigma = \sigma(u)$  and let  $\tau = \sigma(v)$ . Because of the second assertion of the previous lemma we may assume that  $\sigma$  and  $\tau$  generate  $\mathfrak{G}(K/F)$ . Let  $E$  be the fixed field of  $\sigma\tau$ . If

$$t = \{\min(\psi_{K/F}(v_{K/F}(\sigma)), \psi_{K/F}(v_{K/F}(\tau)))\}$$

and  $G = \mathfrak{G}(K/F)$  then  $G = G_t \neq G_{t+1}$ . According to Lemma 6.11, if

$$s = \min\{v_{K/F}(u), v_{K/F}(v)\},$$

then  $t \geq \psi_{K/F}(s)$  which, by Lemma 6.10, is therefore equal to  $s$ . Since  $\tau_{K/F}(uv) = \tau_{K/F}(u)\tau_{K/F}(v)$ ,  $\tau_{K/F}(uv)$  lies in  $U_F^s$ . On the other hand

$$\tau_{K/F}(uv) = N_{E/F}(\tau_{K/E}(uv))$$

so that, by Lemma 6.10 again,  $\tau_{K/E}(uv)$  belongs to  $U_E^s$  and

$$v_{K/F}(uv) \geq \varphi_{E/F}(s) = s.$$

Thus the sets  $W_{K/F}^x$ ,  $x \geq -1$ , give a filtration of  $W_{K/F}$  by a collection of normal subgroups. The next sequence of lemmas show that the filtration is quite analogous to the upper filtration of the Galois groups.

**Lemma 6.14**

For each  $x \geq -1$  the map  $\tau_{K/F, L/F}$  takes  $G_{K/F}^x$  into  $G_{L/F}^x$ .

If  $w$  belongs to  $W_{K/F}$  let  $\bar{w} = \tau_{K/F, L/F}(w)$ . We must show that

$$v_{L/F}(\bar{w}) \geq v_{K/F}(w).$$

Let  $\sigma = \sigma(w)$  and let  $\bar{\sigma} = \sigma(\bar{w})$ . If  $E$  is the fixed field of  $\sigma$  then  $\bar{E} = E \cap L$  is the fixed field of  $\bar{\sigma}$ . Since

$$v_{L/F}(\bar{w}) = \varphi_{\bar{E}/F}(v_{L/\bar{E}}(\bar{w}))$$

and

$$v_{K/F}(w) = \varphi_{\bar{E}/F}(v_{K/\bar{E}}(w))$$

we may suppose  $\overline{E} = F$ . Since  $\tau_{K/F}(w) = \tau_{L/F}(\bar{w})$ , Lemma 6.12 implies that  $\tau_{L/F}(\bar{w})$  lies in  $U_F^{v_{K/F}(w)}$ . Thus

$$v_{L/F}(\bar{w}) = v_F(\tau_{L/F}(\bar{w})) \geq v_{K/F}(w).$$

Of course  $W_{F/F}$  is  $C_F$  and, if  $v \geq -1$ ,  $W_{F/F}^v = U_F^v$ .

**Lemma 6.15**

*For each  $v \geq -1$ ,  $\tau_{K/F}$  maps  $W_{K/F}^v$  onto  $U_F^v$ .*

Since  $v_1 \leq v_2$  implies  $W_{K/F}^{v_2} \subseteq W_{K/F}^{v_1}$  it is enough to prove the lemma when  $v = n$  is an integer. The lemma is clear if  $[K : F] = 1$ ; so we proceed by induction on  $[K : F]$ . If  $[K : F] > 1$ , choose an intermediate normal extension  $L$  so that  $[L : F] = \ell$  is a prime. Let  $\overline{G} = \mathfrak{G}(L/F)$ . Lemma 6.12 implies that

$$W_{K/L}^{\psi_{L/F}(v)} = W_{K/L} \cap W_{K/F}^v.$$

There is an integer  $t \geq -1$  such that  $\overline{G} = \overline{G}_t$  and  $\overline{G}_{t+1} = \{1\}$ . It is shown in Chapter V of Serre's book that if  $n > t$

$$N_{L/F} \left( U_L^{\psi_{L/F}(n)} \right) = U_F^n.$$

By induction

$$\tau_{K/L} \left( W_{K/L}^{\psi_{L/F}(n)} \right) = U_L^{\psi_{L/F}(n)}.$$

Since  $\tau_{K/F}(w) = N_{L/F}(\tau_{K/L}(w))$  if  $w$  is in  $W_{K/L}$ ,

$$\tau_{K/F}(W_{K/F}^n) = U_F^n$$

if  $n > t$ . Suppose  $\overline{\sigma}$  generates  $\overline{G}$ . Then  $V_{L/F}(\overline{\sigma}) = t$ . By Herbrand's theorem there is a  $\sigma$  in  $\mathfrak{G}(K/F)$  with  $v_{K/F}(\sigma) = t$  whose restriction to  $L$  is  $\overline{\sigma}$ . By Lemma 6.11 there is a  $w$  in  $W_{K/F}$  such that  $\sigma = \sigma(w)$  and  $v_{K/F}(w) = t$ . Then  $\tau_{K/F}(w)$  lies in  $U_F^t$  but not in  $N_{L/F}(C_L)$ . From Serre's book again

$$\left[ U_F^t : N_{L/F} U_F^{\psi_{L/F}(t)} \right] = \ell$$

so that  $U_F^t$  is generated by  $\tau_{K/F}(w)$  and  $N_{L/F}(U_L^{\psi_{L/F}(t)})$  and hence is contained in the image of  $W_{K/F}^t$ . To complete the proof of the lemma we have only to observe that Lemma 6.10 implies that

$$U_F^n = U_F^t N_{L/F} \left( U_L^{\psi_{L/F}(n)} \right)$$

if  $n \leq t$ .

**Lemma 6.16**

*Suppose  $F \subseteq L \subseteq K$  and  $L/F$  and  $K/F$  are Galois. Then, for each  $v \geq -1$ ,  $\tau_{K/F, L/F}$  maps  $W_{K/F}^v$  onto  $W_{L/F}^v$ .*

If  $[L : F] = 1$  this is just the previous lemma so we proceed by induction on  $[L : F]$ . We have to show that if  $\bar{w}$  belongs to  $W_{L/F}$  there is a  $w$  in  $W_{K/F}$  such that  $\bar{w} = \tau_{K/F, L/F}(w)$  and  $v_{K/F}(w) \geq v_{L/F}(\bar{w})$ . Let  $\bar{\sigma} = \sigma(\bar{w})$  and let  $\bar{E}$  be the fixed field of  $\bar{\sigma}$ . If  $\bar{E} \neq F$  then, by the induction assumption, there is a  $w$  in  $W_{K/\bar{E}}$  such that  $\tau_{K/\bar{E}, L/\bar{E}}(w) = \bar{w}$  and  $v_{K/\bar{E}}(w) \geq v_{L/\bar{E}}(\bar{w})$ . By Lemma 6.12,  $v_{K/F}(w) \geq v_{L/F}(\bar{w})$ . Moreover, we may assume that  $\tau_{K/\bar{E}, L/\bar{E}}$  is the restriction to  $W_{K/\bar{E}}$  of  $\tau_{K/F, L/F}$ .

Suppose  $\bar{E} = F$ . Then  $v_{L/F}(\bar{w}) = v_F(\tau_{L/F}(\bar{w}))$ . Choose  $w_1$  in  $W_{K/F}$  so that  $\tau_{K/F}(w_1) = \tau_{L/F}(\bar{w})$  and  $v_{K/F}(w_1) \geq v_F(\tau_{L/F}(\bar{w}))$ . Let  $\bar{w}_1 = \tau_{K/F, L/F}(w_1)$  and set  $\bar{u} = \bar{w}_1^{-1}\bar{w}$ . Certainly  $v_{L/F}(\bar{u}) \geq v_{L/F}(\bar{w})$ . Moreover,  $\tau_{L/F}(\bar{u}) = 1$ . Let  $F \subseteq L_1 \subseteq L$  where  $L_1/F$  is cyclic of prime order. If  $\bar{u}$  does not belong to  $W_{L/L_1}$  the group  $C_F$  is generated by  $N_{L_1/F}(C_{L_1})$  and  $\tau_{L/F}(\bar{u})$ , which is impossible since  $\tau_{L/F}(\bar{u}) = 1$ . Thus  $\bar{u}$  belongs to  $W_{L/L_1}$  and, as observed, there is a  $u$  in  $W_{K/L_1}$  such that  $\tau_{K/F, L/F}(u) = \tau_{K/L_1, L/L_1}(u) = \bar{u}$ . Then  $\tau_{K/F, L/F}(uw_1) = \bar{w}$ .

## Chapter Seven.

### Consequences of Stickelberger's Result

Davenport and Hasse [5] have shown that Stickelberger's arithmetic characterization of Gaussian sums over a finite field can be used to establish identities between these Gaussian sums. After reviewing Stickelberger's result we shall prove the identities of Davenport and Hasse together with some more complicated identities. However for the proof of Stickelberger's result itself, I refer to Davenport and Hasse.

If  $Z = e^{\frac{2\pi i}{p}}$  and  $\alpha$  belongs to  $GF(p)$  the meaning of  $Z^\alpha$  is clear. If  $\kappa$  is any finite field and  $S$  is the absolute trace of  $\kappa$  let  $\psi_\kappa^0$  be the character of  $\kappa$  defined by  $\psi_\kappa^0(\alpha) = Z^{S(\alpha)}$ . If  $\chi_\kappa$  is any character of  $\kappa^*$  and  $\psi_\kappa$  is any non-trivial additive character of  $\kappa$  we will take the Gaussian sum  $\tau(\chi_\kappa, \psi_\kappa)$  to be

$$-\sum_{\alpha \in \kappa^*} \chi_\kappa^{-1}(\alpha) \psi_\kappa(\alpha).$$

We abbreviate  $\tau(\chi_\kappa, \psi_\kappa^0)$  to  $\tau(\chi_\kappa)$ .

Let  $\mathbb{k}_n$  be the field obtained by adjoining the  $n^{\text{th}}$  roots of unity to the rational numbers. If  $\varpi = Z - 1$  then in  $\mathbb{k}_p$  the ideal  $(p)$  equals  $(\varpi^{p-1})$ . If  $q = p^f$  and  $\kappa$  has  $q$  elements then in  $\mathbb{k}_{q-1}$  the ideal  $(p)$  is a product  $\mathfrak{p}\mathfrak{p}' \dots$  where the residue fields of  $\mathfrak{p}\mathfrak{p}', \dots$  are isomorphic to  $\kappa$ . In  $\mathbb{k}_{p(q-1)}$

$$(p) = (\mathfrak{p}\mathfrak{p}' \dots)^{p-1}$$

with  $\mathfrak{P} = (\mathfrak{p}, \varpi)$ ,  $\mathfrak{P}' = (\mathfrak{p}', \varpi)$ , and so on. The residue fields of  $\mathfrak{P}, \mathfrak{P}', \dots$  are also isomorphic to  $\kappa$ . Choose one of these prime ideals, say  $\mathfrak{P}$ . Once an isomorphism of the residue field with  $\kappa$  is chosen the map of the  $(q-1)^{\text{th}}$  roots of unity to the residue field defines an isomorphism of  $\kappa^*$  and the group of  $(q-1)^{\text{th}}$  roots of unity. Then  $\chi_\kappa$  can be regarded as a character of the latter group. Choose  $\alpha = \alpha(\chi_\kappa, \mathfrak{P})$  with  $0 \leq \alpha < q-1$  so that  $\chi_\kappa(\zeta) = \zeta^\alpha$  for all  $(q-1)^{\text{th}}$  roots of unity. Write

$$\alpha = \alpha_0 + \alpha_1 p + \dots + \alpha_{f-1} p^{f-1} \quad 0 \leq \alpha_i < p.$$

Not all of the  $\alpha_i$  can be equal to  $p-1$ . Set

$$\begin{aligned} \sigma(\alpha) &= \alpha_0 + \alpha_1 + \dots + \alpha_{f-1} \\ \gamma(\alpha) &= \alpha_0! \alpha_1! \dots \alpha_{f-1}! \end{aligned}$$

The following lemma is Stickelberger's arithmetical characterization of  $\tau(\chi_\kappa)$ .

**Lemma 7.1**

- (a)  $\tau(\chi_\kappa)$  lies in  $\mathbb{F}_{p(q-1)}$  and is an algebraic integer.
- (b) If  $\chi_\kappa = 1$  then  $\tau(\chi_\kappa) = 1$  but if  $\chi_\kappa \neq 1$  the absolute value of  $\tau(\chi_\kappa)$  and all its conjugates is  $\sqrt{q}$ .
- (c) Every prime divisor of  $\tau(\chi_\kappa)$  in  $\mathbb{F}_{p(q-1)}$  is a divisor of  $p$ .
- (d) If  $\beta$  is a non-zero element of the prime field then the automorphism  $Z \rightarrow Z^\beta$  of  $\mathbb{F}_{p(q-1)}$  over  $\mathbb{F}_{q-1}$  sends  $\tau(\chi_\kappa)$  to  $\chi_\kappa(\beta) \tau(\chi_\kappa)$ .
- (e) If  $\mathfrak{P}$  is a prime divisor of  $p$  in  $\mathbb{F}_{p(q-1)}$  and  $\alpha = \alpha(\chi_\kappa, p)$  the multiplicative congruence

$$\tau(\chi_\kappa) \equiv \frac{\varpi^\sigma(\alpha)}{\gamma(\alpha)} \pmod{\mathfrak{P}}$$

is valid.

- (f) Suppose  $\ell$  is a prime dividing  $q - 1$  and  $\chi_\kappa = \chi'_\kappa \chi''_\kappa$  where the order of  $\chi'_\kappa$  is a power of  $\ell$  and that of  $\chi''_\kappa$  is prime to  $\ell$ . If  $\ell^a$  is the exact power of  $\ell$  dividing  $q - 1$  and  $\lambda = \zeta_0 - 1$  where  $\zeta_0$  is a primitive  $\ell^a$ -th root of unity then

$$\tau(\chi_\kappa) \equiv \tau(\chi''_\kappa) \pmod{\lambda}.$$

Before stating the identities for Gaussian sums which are implied by this lemma, I shall prove a few elementary lemmas.

**Lemma 7.2**

Suppose  $0 \leq \alpha < p^f - 1$  and

$$\alpha = \alpha_0 + \alpha_1 p + \dots + \alpha_{f-1} p^{f-1} \quad 0 \leq \alpha_i < p.$$

Suppose also that  $0 \leq j_0 < j_1 < \dots < j_r = f$  and set

$$\beta_s = \alpha_{j_s} + \alpha_{j_s+1} p + \dots + \alpha_{j_{s+1}-1} p^{j_{s+1}-j_s-1}.$$

If  $\sigma = \sum_{s=0}^{r-1} \beta_s$  and  $\gamma = \prod_{s=0}^{r-1} \beta_s!$  then

$$\frac{\varpi^\sigma}{\gamma} = \frac{\varpi^{\sigma(\alpha)}}{\gamma(\alpha)} \pmod{\mathfrak{P}}.$$

First of all, I remark once and for all that if  $n \geq 1$ ,  $0 < u \leq p^n - 1$ , and  $v = u \pmod{p^n}$  then  $v \equiv u \pmod{*p}$ . Thus if  $0 \leq u \leq p^n - 1$  and  $v \geq 0$

$$(u + vp^n)! = (vp^n)! \prod_{w=1}^u (w + vp^n) \equiv u!(vp^n)! \pmod{*p}.$$

Also if  $v \geq 0$

$$\prod_{w=1}^{p^n} (vp^n + w) \equiv (v+1)p^n! \pmod{*p}$$

and, by induction,

$$(vp^n)! \equiv v!(p^n!)^v \pmod{*p}.$$

In particular  $p^{(n+1)}! \equiv p!(p^n!)^p \equiv (-p)(p^n!)^p$ . Apply induction to obtain

$$p^n! \equiv (-p)^{\frac{p^n-1}{p-1}} \pmod{*p}.$$

From the relations

$$p = \prod_{i=1}^{p-1} (1 - Z^i) = (-\varpi)^{p-1} \prod_{i=1}^{p-1} \frac{Z^i - 1}{Z - 1}$$

and

$$\frac{Z^i - 1}{Z - 1} = 1 + Z + \dots + Z^{i-1} \equiv i \pmod{*p}.$$

We conclude that

$$p = (p-1)!(-\varpi)^{p-1} \equiv -\varpi^{p-1} \pmod{*p}.$$

The lemma itself is clear if  $r = f$  so we proceed by induction downward from  $f$ . Suppose  $r < f$ ,  $j_{s+2} - j_s = t > 1$ , and the lemma is valid for the sequence  $j_0, j_1, \dots, j_{s+1} - 1, j_{s+1}, \dots, j_r$ . To prove it for the given sequence we have only to show that if

$$x = \alpha_{j_s} + \alpha_{j_{s+1}} p + \dots + \alpha_{j_{s+1}-2} p^{t-2}$$

and  $y = \alpha_{j_{s+1}-1}$  then

$$\frac{\varpi^{x+y}}{x!y!} \equiv \frac{\varpi^{x+yp^{t-1}}}{(x+yp^{t-1})!} \pmod{*p}.$$

But

$$\varpi^{y(p^{t-1}-1)} \equiv (-p)^{y\frac{p^{t-1}-1}{p-1}} \pmod{*p}$$

and

$$(x + yp^{t-1})! = x!y!(p^{t-1}!)^y \equiv x!y!(-p)^{\frac{y^{t-1}-1}{p-1}} \pmod{*p}.$$

**Lemma 7.3**

Suppose  $\beta_0, \dots, \beta_{r-1}$  and  $\gamma_0, \dots, \gamma_{r-1}$  are non-negative integers all of which are less than or equal to  $q - 1$ . Suppose that  $q = p^f$  is a prime power and

$$\sum_{i=0}^{r-1} (\beta_i + \gamma_i) q^i < 2(q^r - 1).$$

Suppose also that  $\delta_i, 0 \leq i \leq r - 1$ , are given such that  $0 \leq \delta_i \leq q - 1$ ,

$$\sum_{i=0}^{r-1} \delta_i q^i < q^r - 1$$

and

$$\sum_{i=0}^{r-1} (\beta_i + \gamma_i) q^i = \sum_{i=0}^{r-1} \delta_i q^i \pmod{q^r - 1}.$$

(a) If  $\sum_{i=0}^{r-1} (\beta_i + \gamma_i) q^i < q^{r-1}$  and if  $\nu$  is the number of  $k, 1 \leq k \leq r$ , for which  $\sum_{i=0}^{k-1} (\beta_i + \gamma_i) \geq q^k$  then

$$\sum_{i=0}^{r-1} (\beta_i + \gamma_i - \delta_i) = \nu(q - 1).$$

(b) If  $\sum_{i=0}^{r-1} (\beta_i + \gamma_i) q^i \geq q^r - 1$  and if  $\nu$  is the number of  $k, 1 \leq k \leq r$ , for which  $1 \neq \sum_{i=0}^{k-1} (\beta_i + \gamma_i) q^i \geq q^k$  then

$$\sum_{i=0}^{r-1} (\beta_i + \gamma_i - \delta_i) = \nu(q - 1).$$

Observe immediately that if  $1 \leq k \leq r$ , then  $0 \leq \beta_{k-1} + \gamma_{k-1} \leq 2(q - 1)$  and

$$\sum_{i=0}^{k-1} (\beta_i + \gamma_i) q^i \leq 2(q - 1) \sum_{i=0}^{k-1} q^i = 2(q^k - 1).$$

If  $r = 1$  then  $\beta_0 + \gamma_0 = \delta_0 + \varepsilon(q - 1)$  with  $\varepsilon$  equal to 0 or 1. If  $\varepsilon = 0$  we are in case (a) and  $\nu = 0$  while  $\beta_0 + \gamma_0 - \delta_0 = 0$ . If  $\varepsilon = 1$  we are in case (b); here  $\nu = 1$  and  $\beta_0 + \gamma_0 - \delta_0 = q - 1$ . Suppose then that  $r \geq 2$  and that if  $\beta'_0, \dots, \beta'_{r-1}, \gamma'_0, \dots, \gamma'_{r-2}, \delta'_0, \dots, \delta'_{r-2}$ , and  $\nu'$  are given as in the lemma (with  $r$  replaced by  $r - 1$ ) then

$$\sum_{i=0}^{r-2} (\beta'_i + \gamma'_i - \delta'_i) = \nu'(q - 1).$$

We establish part (a) first. In this case

$$\sum_{i=0}^{r-1} (\beta_i + \gamma_i) q^i = \sum_{i=0}^{r-1} \delta_i q^i$$

and

$$\sum_{i=0}^{r-2} (\beta_i + \gamma_i) q^i = \sum_{i=0}^{r-2} \delta_i q^i + \varepsilon q^{r-1}$$

with  $\varepsilon = \delta_{r-1} - \beta_{r-1} - \gamma_{r-1}$ . If  $\varepsilon$  were negative the left side of the equation would be negative; if  $\varepsilon$  were greater than 1 the left side would be greater than  $2(q^{r-1} - 1)$ . Since neither of these possibilities occur  $\varepsilon$  is 0 or 1.

Suppose first that  $\varepsilon = 0$ . If  $\sum_{i=0}^{r-2} \delta_i q^i < q^{r-1} - 1$  choose  $\beta'_i = \beta_i$ ,  $\gamma'_i = \gamma_i$ ,  $0 \leq i \leq r-2$ . Then  $\delta'_i = \delta_i$ ,  $0 \leq i \leq r-2$ , and  $\nu' = \nu$ . The assertion of the lemma follows in this case. If  $\sum_{i=0}^{r-2} \delta_i q^i = q^{r-1} - 1$  then  $\delta_i = q - 1$ ,  $0 \leq i \leq r-2$ . Then  $\beta_0 + \gamma_0 \equiv q - 1 \pmod{q}$  and, as a consequence,  $\beta_0 + \gamma_0 = q - 1$ . We show by induction that  $\beta_i + \gamma_i = q - 1$ ,  $0 \leq i \leq r-2$ . If this is so for  $i < j$  then

$$\sum_{i=j}^{r-2} (\beta_i + \gamma_i) q^i = \sum_{i=j}^{r-2} (q - 1) q^i.$$

Hence  $\beta_j + \gamma_j \equiv q - 1 \pmod{q}$  and  $\beta_j + \gamma_j = q - 1$ . It follows immediately that  $\nu = 0$  and  $\sum_{i=0}^{r-1} (\beta_i + \gamma_i - \delta_i) = 0$ .

Now suppose that  $\varepsilon = 1$ . If

$$\sum_{i=0}^{r-2} (\beta_i + \gamma_i) q^i = 2(q^{r-1} - 1)$$

then  $\beta_i = \gamma_i = q - 1$ ,  $0 \leq i \leq r-2$ ,  $\delta_0 = q - 2$ , and  $\delta_i = q - 1$ ,  $1 \leq i \leq r-2$ . Thus  $\nu = r - 1$  and

$$\sum_{i=0}^{r-1} (\beta_i + \gamma_i - \delta_i) = 1 + (r - 1)(q - 1) - 1 = (r - 1)(q - 1).$$

Suppose then that

$$\sum_{i=0}^{r-2} (\beta_i + \gamma_i) q^i < 2(q^{r-1} - 1).$$

From the relation

$$\sum_{i=0}^{r-2} (\beta_i + \gamma_i) q^i = \sum_{i=0}^{r-2} \delta_i q^i + 1 + (q^{r-1} - 1).$$

We conclude that  $\sum_{i=0}^{r-2} \delta_i q^i < q^{r-1} - 1$ . Then for some  $m$ , with  $0 \leq m \leq r-2$ ,  $\delta_m < q - 1$ . We choose the minimal value for  $m$ .

$$\sum_{i=0}^{r-2} (\beta_i + \gamma_i) q^i = (\delta_m + 1) q^m + \sum_{i=m+1}^{r-2} \delta_i q^i + (q^{r-1} - 1).$$

Thus if  $\beta'_i = \beta_i$ ,  $\gamma'_i = \gamma_i$ ,  $0 \leq i \leq r-2$ , then  $\delta'_i = 0$ ,  $i < m$ ,  $\delta'_m = \delta_m + 1$ , and  $\delta'_i = \delta_i$ ,  $m < i \leq r-2$ . Arguing by congruences as before we see that  $\beta_i + \gamma_i = q-1$  for  $i < m$ . Thus

$$\sum_{i=0}^{k-1} (\beta_i + \gamma_i) q^i = q^k - 1$$

for  $k \leq m$ . However  $\beta_m + \gamma_m \neq q-1$  and thus  $\beta_m + \gamma_m + 1$  is prime to  $q$ . Moreover if  $r-1 \geq k > m$

$$1 + \sum_{i=1}^{k-1} (\beta_i + \gamma_i) q^i \equiv (\beta_m + \gamma_m + 1) q^m \pmod{q^{m+1}}.$$

Thus it is greater than or equal to  $q^k$  if and only if it is greater than or equal to  $q^k + 1$ . It follows that  $\nu' = \nu + m$  and that

$$\sum_{i=0}^{r-2} (\beta_i + \gamma_i - \delta_i) = -m(q-1) + \sum_{i=0}^{r-2} (\beta'_i + \gamma'_i - \delta'_i) = \nu(q-1) + 1.$$

Since  $\beta_{r-1} + \gamma_{r-1} - \delta_{r-1} = -1$  the assertion of the lemma follows.

Now let us treat part (b). In this case

$$\sum_{i=0}^{r-1} (\beta_i + \gamma_i) q^i = \sum_{i=0}^{r-1} \delta_i q^i + (q^r - 1)$$

and

$$1 + \sum_{i=0}^{r-2} (\beta_i + \gamma_i) q^i = \sum_{i=0}^{r-2} \delta_i q^i + \varepsilon q^{r-1}$$

with  $\varepsilon = \delta_{r-1} - \beta_{r-1} - \gamma_{r-1} + q$ . Again  $\varepsilon$  is 0 or 1. If  $\beta_i = \gamma_i = q-1$  for  $0 \leq i \leq r-2$  then  $\varepsilon = 1$  and  $\delta_i = q-1$  for  $0 \leq i \leq r-2$ . Also  $\nu = r$  and

$$\sum_{i=0}^{r-1} (\beta_i + \gamma_i - \delta_i) = (r-1)(q-1) + \beta_{r-1} + \gamma_{r-1} - \delta_{r-1} = r(q-1).$$

Having taken care of this case, we suppose that

$$\sum_{i=0}^{r-2} (\beta_i + \gamma_i) q^i < 2(q^{r-1} - 1).$$

First take  $\varepsilon = 0$ . If  $\delta_0 = 0$  then  $1 + \beta_0 + \gamma_0 \equiv 0 \pmod{q}$  and  $\beta_0 + \gamma_0 = q-1$ . Thus one of them is less than  $q-1$ . By symmetry we may suppose it is  $\beta_0$ . Let  $\beta'_0 = \beta_0 + 1$ ,  $\beta'_i = \beta_i$ ,  $1 \leq i \leq r-2$ , and  $\gamma'_i = \gamma_i$ ,  $0 \leq i \leq r-2$ . Since  $\delta_0 = 0$

$$\sum_{i=0}^{r-2} \delta_i q^i \leq q^{r-1} - q < q^{r-1} - 1$$

and  $\delta'_i = \delta_i$ ,  $0 \leq i \leq r-1$ . Also  $\nu = \nu' + 1$  so that

$$\sum_{i=0}^{r-1} (\beta_i + \gamma_i - \delta_i) = \sum_{i=0}^{r-2} (\beta'_i + \gamma'_i - \delta'_i) - 1 + q = \nu(q-1)$$

as required. If  $\delta_0 > 0$  take  $\beta'_i = \beta_i$  and  $\gamma'_i = \gamma_i$ ,  $0 \leq i \leq r-2$ . Then  $\delta'_0 = \delta_0 - 1$ ,  $\delta'_i = \delta_i$ ,  $1 \leq i \leq r-2$ . Also if  $k \leq r-1$

$$\sum_{i=0}^{k-1} (\beta_i + \gamma_i)q^i \equiv \delta_0 - 1 \not\equiv -1 \pmod{q}$$

and the left-hand side is greater than or equal to  $q^k$  if and only if it is greater than or equal to  $q^k - 1$ . It follows that  $\nu = \nu' + 1$ . Consequently

$$\sum_{i=0}^{r-1} (\beta_i + \gamma_i - \delta_i) = \sum_{i=0}^{r-2} (\beta'_i + \gamma'_i - \delta'_i) - 1 + q = \nu(q-1).$$

If  $\varepsilon = 1$  take  $\gamma'_i = \gamma_i$  and  $\beta'_i = \beta_i$ ,  $0 \leq i \leq r-2$ . Then  $\delta'_i = \delta_i$ ,  $0 \leq i \leq r-2$ , and  $\nu = \nu' + 1$  so that

$$\sum_{i=0}^{r-1} (\beta_i + \gamma_i - \delta_i) = \nu'(q-1) + (\beta_{r-1} + \gamma_{r-1} - \delta_{r-1}) = \nu(q-1).$$

#### Lemma 7.4

Suppose  $\beta_i$  and  $\gamma_i$  are two periodic sequences of integers with period  $r$ . That is  $\beta_{i+r} = \beta_i$  and  $\gamma_{i+r} = \gamma_i$  for all  $i$  in  $\mathbb{Z}$ . Suppose  $0 \leq \beta_i \leq q-1$ ,  $0 \leq \gamma_i \leq q-1$  for all  $i$  and that none of the numbers

$$\varepsilon_k = \sum_{i=0}^{r-1} (\beta_{i+k} + \gamma_{i+k})q^i$$

is divisible by  $q^r - 1$ . Let

$$\sum_{i=0}^{r-1} (\beta_i + \gamma_i)q^i \equiv \sum_{i=0}^{r-1} \delta_i q^i \pmod{q^r - 1}$$

with  $0 \leq \delta_i \leq q-1$  and  $\sum_{i=0}^{r-1} \delta_i q^i < q^r - 1$ . If  $\mu$  is the number of  $\varepsilon_k$ ,  $1 \leq k \leq r$ , which are greater than or equal to  $q^r - 1$  then

$$\sum_{i=0}^{r-1} (\beta_i + \gamma_i - \delta_i) = \mu(q-1).$$

Since  $\varepsilon_0 \leq 2(q^r - 1)$  and is not divisible by  $q^r - 1$  it is less than  $2(q^r - 1)$ . Thus all we need do is show that the  $\mu$  of this lemma is equal to the  $\nu$  of the preceding lemma. Observe first of all that  $\varepsilon_j \geq q^r - 1$  if and only if  $\varepsilon_j \geq q^r$ .

Suppose  $\varepsilon_0 < q^r$ . If  $1 \leq k < r$

$$\sum_{i=k}^{r-1} (\beta_i + \gamma_i) q^i < q^r$$

so that

$$\sum_{i=k}^{r-1} (\beta_i + \gamma_i) q^{i-k} < q^{r-k}.$$

Thus, if  $\varepsilon_k \geq q^r$ ,

$$\begin{aligned} q^r &\leq \sum_{i=r-k}^{r-1} (\beta_{i+k} + \gamma_{i+k}) q^i + \sum_{i=0}^{r-k-1} (\beta_{i+k} + \gamma_{i+k}) q^i \\ &< q^{r-k} \sum_{i=0}^{k-1} (\beta_i + \gamma_i) q^i + q^{r-k} \end{aligned}$$

and

$$\sum_{i=0}^{k-1} (\beta_i + \gamma_i) q^i \geq q^k.$$

Conversely if  $1 \leq k < r$  and

$$\sum_{i=0}^{k-1} (\beta_i + \gamma_i) q^i \geq q^k,$$

then

$$\begin{aligned} \sum_{i=0}^{r-1} (\beta_{i+k} + \gamma_{i+k}) q^i &\geq \sum_{i=r-k}^{r-1} (\beta_{i+k} + \gamma_{i+k}) q^i \\ &= q^{r-k} \sum_{i=0}^{k-1} (\beta_i + \gamma_i) q^i \geq q^r. \end{aligned}$$

Thus  $\mu = \nu$  in this case.

Now suppose  $\varepsilon_0 \geq q^r$ . If  $1 \leq k < r$

$$\sum_{i=k}^{r-1} (\beta_i + \gamma_i) q^i \geq q^r - \sum_{i=0}^{k-1} (\beta_i + \gamma_i) q^i \geq q^r - 2(q^k - 1).$$

If

$$\sum_{i=0}^{k-1} (\beta_i + \gamma_i) q^i \geq q^k - 1$$

then

$$\begin{aligned} \sum_{i=0}^{r-1} (\beta_{i+k} + \gamma_{i+k}) q^i &\geq \sum_{i=r-k}^{r-1} (\beta_{i+k} + \gamma_{i+k}) q^i + \sum_{i=0}^{r-k-1} (\beta_{i+k} + \gamma_{i+k}) q^i \\ &= q^{r-k} \sum_{i=0}^{k-1} (\beta_i + \gamma_i) q^i + q^{r-k} \sum_{i=k}^{r-1} (\beta_i + \gamma_i) q^i \\ &\geq q^{r-k} (q^k - 1) + q^{r-k} - 2 + 2q^{-k}. \end{aligned}$$

Thus  $\varepsilon_k \geq q^r - 1$  and hence  $\varepsilon_k \geq q^r$ . Conversely if  $\varepsilon_k \geq q^r$ ,

$$\begin{aligned} q^{r-k} \sum_{i=0}^{k-1} (\beta_i + \gamma_i) q^i &= \sum_{i=r-k}^{r-1} (\beta_{i+k} + \gamma_{i+k}) q^i \\ &\geq q^r - \sum_{i=0}^{r-k-1} (\beta_{i+k} + \gamma_{i+k}) q^i \\ &\geq q^r - 2(q^{r-k} - 1) \\ &= q^r - 2q^{r-k} + 2. \end{aligned}$$

Thus

$$\sum_{i=0}^{k-1} (\beta_i + \gamma_i) q^i \geq q^k - 1$$

and again  $\mu = \nu$ .

### Lemma 7.5

Suppose  $q = p^f$  is a prime power,  $\ell$  is a positive integer, and  $(\ell, q) = 1$ . Let  $\ell m \equiv 1 \pmod{q}$  and if  $x$  is any integer let  $\varphi(x)$ , with  $0 \leq \varphi(x) < q$ , be the remainder of  $x$  upon division by  $q$ . If  $0 \leq \beta < q$  and if  $\psi(x) = \varphi(x)!$

$$\frac{\ell\beta}{\beta!} \prod_{k=0}^{\ell-1} \frac{\psi((\beta-k)m)}{\psi(-km)} \equiv 1 \pmod{*p}.$$

If  $\ell = \ell_1 + uq$  with  $\ell_1 > 0$  and  $u \geq 0$  then  $\ell^\beta \equiv \ell_1^\beta \pmod{*p}$ . Moreover

$$\prod_{k=0}^{\ell-1} \frac{\psi((\beta-k)m)}{\psi(-km)} = \left\{ \prod_{k=0}^{\ell_1-1} \frac{\psi((\beta-k)m)}{\psi(-km)} \right\} \left\{ \prod_{k=\ell_1}^{\ell-1} \frac{\psi((\beta-k)m)}{\psi(-km)} \right\}$$

and

$$\prod_{k=\ell_1}^{\ell-1} \psi(-km) = \left\{ \prod_{j=0}^{q-1} j! \right\}^u = \prod_{k=\ell_1}^{\ell-1} \psi((\beta-k)m).$$

Thus it is enough to prove the lemma with  $\ell$  replaced by  $\ell_1$ . In other words we may suppose that  $0 < \ell < q$ . The case  $\ell = 1$  is trivial and we exclude it from the following discussion. Finally we suppose that  $0 < m < q$ .

the numbers in the array is the order in which they appear when the array is read as though it were a printed page.) The numbers  $\varphi(-km)$ ,  $1 \leq k \leq \ell - 1$ , are the last  $\ell - 1$  numbers of the array, that is, the numbers after  $q - 1$ . Cancelling in the product of the lemma the terms in numerator and denominator corresponding to the last  $\ell - \beta - 1$  terms of the array, we obtain

$$\prod_{j=1}^{\beta} \frac{\varphi(jm)!}{(\varphi(jm) - 1)!} = \prod_{j=1}^{\beta} \varphi(jm) \equiv m^{\beta} \beta! \pmod{*p}$$

as required.

Now take  $\beta \geq \ell - 1$ . Then the numbers  $\beta, \beta - 1, \dots, \beta - (\ell - 1)$  occur as indicated in the first array. In particular there is exactly one in each column. The numerator in the product of the lemma is the product of the factorials of the corresponding elements of the second array. The denominator is the product of the factorials of the elements appearing after  $q - 1$ . As indicated  $t$  is the element lying above  $q - 1$ . Thus  $t$  is larger than any element appearing in a column other than that of  $t$ . The product of the lemma is  $t!$  times the product of the factorials of the other elements on the broken line divided by the factorials of the elements at the foot of the column in which they lie. Thus it equals  $t!$  divided by the product of all the elements below the broken line except those which lie directly below  $t$ . But  $t!$  is the product of all numbers in the second array except those which lie below  $t$ . Thus the quotient is the product of all numbers which lie above or on the broken line, that is,

$$\prod_{j=1}^{\beta} \varphi(jm) \equiv \prod_{j=1}^{\beta} jm = m^{\beta} \beta! \pmod{*p}$$

as required.

### Lemma 7.6

Suppose that  $q = p^f$  is a prime power, that  $\ell$  is a positive integer dividing  $q - 1$ , that  $0 \leq \alpha_1 < q - 1$ , that  $(\ell, \alpha_1) = 1$ , and that

$$\alpha_2 = \frac{\alpha_1}{\ell} \cdot \frac{q^{\ell} - 1}{q - 1}.$$

Then  $\alpha_2$  is an integer and  $0 \leq \alpha_2 < q - 1$ . Moreover if

$$\alpha_2 = \gamma_0 + \gamma_1 q + \dots + \gamma_{\ell-1} q^{\ell-1}$$

with  $0 \leq \gamma_i \leq q - 1$  for  $0 \leq i \leq \ell - 1$  then

$$\sum_{j=0}^{\ell-1} \gamma_j = \alpha_1 + \sum_{j=1}^{\ell-1} j \cdot \frac{q - 1}{\ell}$$

and

$$\ell^{\alpha_1} \prod_{j=0}^{\ell-1} \gamma_j! \equiv \alpha_1! \prod_{j=1}^{\ell-1} \left( \frac{jq-1!}{\ell} \right) \pmod{p}.$$

Certainly  $0 \leq \alpha_2 < q^\ell - 1$ ; moreover

$$\frac{q^\ell - 1}{q - 1} = 1 + q + \dots + q^{\ell-1} \equiv \ell \pmod{\ell}$$

so that  $\alpha_2$  is an integer. Let  $\alpha_1 = m\ell + k$  with  $m \geq 0$  and  $0 \leq k < \ell$  and for  $0 \leq j < \ell$  let

$$(\ell - 1 - j)k = i_j + \delta_j \ell$$

with  $\delta_j \geq 0$  and  $0 \leq i_j < \ell$ . Clearly  $i_{\ell-1} = \delta_{\ell-1} = 0$ . Also  $(\ell - 1)k = \ell - k + \ell(k - 1)$  so that  $i_0 = \ell - k$  and  $\delta_0 = k - 1$ . If  $j \geq 1$  then  $(\delta_{j-1} - \delta_j)\ell = k + (i_j - i_{j-1})$ . Since  $-\ell < i_j - i_{j-1} < \ell$  and  $0 < k < \ell$  the right-hand side is greater than  $-\ell$  and less than  $2\ell$  so that  $\delta_{j-1} - \delta_j$  is 0 or 1. If it is 1 then  $k + i_j \geq \ell$  and  $i_j \geq \ell - k$ . If it is 0 then  $i_j = i_{j-1} - k < \ell - k$ . Recalling that  $i_0 = \ell - k$  we see that

$$S = \{j | 1 \leq j \leq \ell - 1 \text{ and } \delta_{j-1} - \delta_j = 1\} = \{j | 0 \leq j < \ell \text{ and } i_j > \ell - k\}.$$

We shall prove that

$$\gamma_0 = m + i_0 \frac{(q-1)}{\ell} + k - \delta_0$$

and

$$\gamma_j = m + i_j \frac{(q-1)}{\ell} + \delta_{j-1} - \delta_j \quad 1 \leq j < \ell.$$

Since  $(k, \ell) = 1$  the numbers  $i_j$  are distinct and it will follow immediately that

$$\sum_{j=0}^{\ell-1} \gamma_j = (m\ell + k) + \sum_{j=0}^{\ell-1} j \cdot \frac{q-1}{\ell} = \alpha_1 + \sum_{j=1}^{\ell-1} j \cdot \frac{q-1}{\ell}.$$

Moreover we will have

$$\prod_{j=0}^{\ell-1} \gamma_j! = \left\{ \prod_{j=0}^{\ell-1} \left( m + j \frac{(q-1)}{\ell} \right)! \right\} \left\{ m + i_0 \frac{q-1}{\ell} + k - \delta_0 \right\} \left\{ \prod_{j \in S} \left( m + 1 + i_j \frac{(q-1)}{\ell} \right) \right\}.$$

Recall that  $k - \delta_0 = 1$ . Dividing the first term by

$$\prod_{j=0}^{\ell-1} \left( j \cdot \frac{(q-1)}{\ell} \right)!$$

we obtain

$$\prod_{j=0}^{\ell-1} \prod_{n=1}^m \left( n + j \frac{(q-1)}{\ell} \right).$$

The product of the last two terms is

$$\prod_{j=\ell-k}^{\ell-1} \left( m+1 + j \frac{(q-1)}{\ell} \right).$$

If  $1 \leq n \leq m$  and  $0 \leq j \leq \ell-1$  then  $n\ell - j < \alpha_1 < q$  so that the product of  $\ell^{mk}$  and the first of these two expressions is multiplicatively congruent to

$$\prod_{j=0}^{\ell-1} \prod_{n=1}^m (n\ell - j) = (m\ell)!$$

Moreover, if  $\ell - k \leq j \leq \ell-1$ , then  $0 \leq (m+1)\ell - j \leq (m+1)\ell - (\ell - k) = \alpha_1 < q$  and the second of these expressions upon multiplication by  $\ell^k$  becomes multiplicatively congruent to

$$\prod_{j=\ell-k}^{\ell-1} ((m+1)\ell - j) = \prod_{j=1}^k (m\ell + j).$$

The relations together imply the second identity of the lemma.

To verify that the  $\gamma_j$ ,  $0 \leq j < \ell$ , have the form asserted, we start with the relation

$$\alpha_2 = \frac{q^\ell - 1}{q - 1} \cdot \frac{m\ell + k}{\ell} = \sum_{j=0}^{\ell-1} q^j m + \sum_{j=0}^{\ell-1} \frac{q^j k}{\ell}.$$

The second term is equal to

$$\sum_{j=0}^{\ell-1} \left\{ \left( \sum_{i=0}^{j-1} q^i \right) \frac{q-1}{\ell} k \right\} + k = k + \sum_{j=0}^{\ell-2} (\ell-1-j) q^j \cdot \frac{q-1}{\ell} \cdot k.$$

Thus

$$\begin{aligned} \alpha_2 &= \left( m + (\ell-1)k \cdot \frac{q-1}{\ell} + k \right) + \sum_{j=1}^{\ell-1} \left( m + (\ell-1-j)k \cdot \frac{q-1}{\ell} \right) q^j \\ &= \left( m + i_0 \cdot \frac{q-1}{\ell} + k - \delta_0 \right) + \sum_{j=1}^{\ell-1} \left( m + i_j \cdot \frac{q-1}{\ell} + \delta_{j-1} - \delta_j \right). \end{aligned}$$

Moreover  $m < \frac{q-1}{\ell}$  so that

$$0 \leq m + i_0 \cdot \frac{q-1}{\ell} + k - \delta_0 < \ell \cdot \frac{q-1}{\ell} + 1 = q$$

and

$$0 \leq m + i_j \cdot \frac{q-1}{\ell} + \delta_{j-1} - \delta_j < \ell \cdot \frac{q-1}{\ell} + 1 = q.$$

The required relations follow immediately.

Now we can state and prove the promised identities for Gaussian sums. Each of these will amount to an assertion that a certain number in  $\mathbb{F}_{p(q-1)}$  is 1. To prove this we will show first that the number is invariant under all automorphisms of  $\mathbb{F}_{p(q-1)}$  over  $\mathbb{F}_{(q-1)}$  and thus lies in  $\mathbb{F}_{q-1}$ . The only prime ideals occurring in the factorization of the number, which is not *a priori* an algebraic integer, into prime ideals will be divisors of  $p$ . We show that every conjugate of the number has absolute value 1 and that it is multiplicatively congruent to 1 modulo every divisor of  $p$ . It will follow that it is a root of unity in  $\mathbb{F}_{q-1}$  and hence a  $(q-1)$ th root of unity if  $q$  is odd and a  $2(q-1)$ th root of unity if  $q$  is even. If  $q$  is odd the multiplicative congruences imply that the number is 1. If  $q$  is even they imply that the number is  $\pm 1$ . To show that it is actually 1 some supplementary discussion will be necessary.

Stickelberger's result is directly applicable only to the normalized Gaussian sum  $\tau(\chi_\kappa)$ . We shall have to use the obvious relation  $\tau(\chi_\kappa, \Psi_\kappa) = \chi_\kappa(\beta)\tau(\chi_\kappa)$  if  $\psi_\kappa(\alpha) = \psi_\kappa^0(\beta\alpha)$ . If  $\kappa$  is an extension of  $\lambda$  and  $\psi_\lambda$  is given, we set

$$\psi_{\kappa/\lambda}(\alpha) = \psi_\lambda(S_{\kappa/\lambda}(\alpha))$$

for  $\alpha$  in  $\kappa$ . If  $\chi_\lambda$  is given  $\chi_{\kappa/\lambda}$  is the character defined by

$$\chi_{\kappa/\lambda}(\alpha) = \chi_\lambda(N_{\kappa/\lambda}(\alpha)).$$

### Lemma 7.7

*If  $\kappa$  is a finite extension of the finite field and  $\chi_\lambda$  and  $\psi_\lambda$  are given then*

$$\tau(\chi_{\kappa/\lambda}, \psi_{\kappa/\lambda}) = \{\tau(\chi_\lambda, \psi_\lambda)\}^{[\kappa:\lambda]}.$$

Since  $\chi_{\kappa/\lambda}(\beta) = \chi_\lambda(\beta)^{[\kappa:\lambda]}$  it will be enough to show that

$$\tau(\chi_{\kappa/\lambda}) = \{\tau(\chi_\lambda)\}^{[\kappa:\lambda]}.$$

Set

$$\mu = \frac{\{\tau(\chi_\lambda)\}^{[\kappa:\lambda]}}{\tau(\chi_{\kappa/\lambda})}.$$

Let  $\lambda$  have  $q = p^\ell$  elements and let  $\kappa$  have  $p^k = q^f$ . It follows immediately from Lemma 7.1 that the absolute value of  $\mu$  and all its conjugates is 1, that it lies in  $\mathbb{k}_{p(q^f-1)}$ , that it is invariant under all automorphisms of  $\mathbb{k}_{p(q^f-1)}$  over  $\mathbb{k}_{q^f-1}$ , and that its only prime factors are divisors of  $p$ . The mapping  $\beta \longrightarrow N_{\kappa/\lambda}\beta$  sends  $\beta$  to  $\beta^{\frac{q^f-1}{q-1}}$ . Thus if  $\alpha = \alpha(\chi_\lambda, \mathfrak{p})$  and  $\mathfrak{P}$  divides  $\mathfrak{p}$

$$\alpha(\chi_{\kappa/\lambda}, p) = \frac{q^f - 1}{q - 1} \alpha = \alpha + \alpha q + \dots + \alpha q^{f-1}.$$

Applying Lemmas 7.1 and 7.2, we see that

$$\tau(\chi_\lambda) \equiv \frac{\varpi^\alpha}{\alpha!} \pmod{\mathfrak{P}}$$

and

$$\tau(\chi_{\kappa/\lambda}) \equiv \frac{\varpi^{f\alpha}}{(\alpha!)^f} \pmod{\mathfrak{P}}.$$

Consequently

$$\mu \equiv 1 \pmod{\mathfrak{P}}.$$

Thus  $\mu = 1$  if  $q$  is odd and  $\mu = \pm 1$  if  $q$  is even. If  $\chi_\lambda = 1$  then  $\chi_{\kappa/\lambda} = 1$  and, from part (b) of Lemma 7.1,  $\mu$  is 1. If  $q = 2$  then  $\chi_\lambda = 1$ . Suppose then  $q$  is even and greater than 2. If  $\chi_\lambda$  is not identically 1 choose a prime  $r$  dividing the order of  $\chi_\lambda$ . Set  $\chi_\lambda = \chi'_\lambda \chi''_\lambda$  where the order of  $\chi'_\lambda$  is a power of  $r$  and the order of  $\chi''_\lambda$  is prime to  $r$ . The analogous decomposition of  $\chi_{\kappa/\lambda}$  is  $\chi'_{\kappa/\lambda} \chi''_{\kappa/\lambda}$ . Of course  $\chi_\lambda$  and  $\chi_{\kappa/\lambda}$  have the same order. Define  $\mu'$  and  $\mu''$  in the obvious way. According to part (f) of Lemma 7.1

$$\mu \equiv \mu'' \pmod{r}.$$

Since  $r$  does not divide 2 this implies that  $\mu = \mu''$ . Thus one can show by induction on the number of primes dividing the order of  $\chi_\lambda$  that  $\mu = 1$ .

### Lemma 7.8

*Suppose  $\lambda$  is a finite field with  $q$  elements,  $\kappa$  is a finite extension of  $\lambda$ , and  $[\kappa : \lambda] = f$ . Suppose  $\ell$  is a prime and the order of  $q$  modulo  $\ell$  is  $f$ . Let  $T$  be a set of representatives for the orbits of the non-trivial characters of  $\kappa^*$  of order  $\ell$  under the action of  $\mathfrak{G}(\kappa/\lambda)$  and let  $\chi_\lambda$  be a character of  $\lambda^*$ . If  $\psi_\lambda$  is any non-trivial character of  $\lambda$*

$$\chi_\lambda(\ell^\ell) \tau(\chi_\lambda^\ell, \psi_\lambda) \prod_{\mu_\kappa \in T} \tau(\mu_\kappa, \psi_{\kappa/\lambda}) = \tau(\chi_\lambda, \psi_\lambda) \prod_{\mu_\kappa \in T} \tau(\chi_{\kappa/\lambda} \mu_\kappa, \psi_{\kappa/\lambda}).$$

Since the isotropy group of each point in  $T$  is trivial

$$\chi_\lambda^\ell(\beta) \prod_{\mu_\kappa \in T} \mu_\kappa(\beta) = \chi_\lambda(\beta) \prod_{\mu_\kappa \in T} \chi_{\kappa/\lambda}(\beta) \mu_\kappa(\beta)$$

and we may content ourselves with showing that

$$\chi_\lambda(\ell^\ell) \tau(\chi_\lambda^\ell) \prod_{\mu_\kappa \in T} \tau(\mu_\kappa) = \tau(\chi_\lambda) \prod_{\mu_\kappa \in T} \tau(\chi_{\kappa/\lambda} \mu_\kappa).$$

Of course  $\chi_\lambda(\ell^\ell)$  is the value of  $\chi_\lambda$  at the element of the prime field corresponding to  $\ell^\ell$ . Let  $\mu$  be the quotient of the right side by the left. The characters of  $\kappa^*$  of order  $\ell$  are the characters  $\mu_\kappa^k$ ,  $0 \leq k < \ell$ , defined by

$$\alpha(\mu_\kappa^k, \mathfrak{P}) = k \cdot \frac{q^f - 1}{\ell}.$$

Since the order of  $q$  modulo  $\ell$  is  $f$ , if  $T = \{\mu_\kappa^k | k \in A\}$  every non-trivial character of order  $\ell$  is representable as  $\mu_\kappa^{\eta(q^i k)}$  with  $0 \leq i < f$  and  $k \in A$ .  $\eta(q^i k)$  is the remainder of  $q^i k$  upon division by  $\ell$ . Thus as we already saw,  $T$  has  $\frac{\ell-1}{f}$  elements. Lemma 7.1 again shows that  $\mu$  and all its conjugates have absolute value 1 and that  $\mu$  is invariant under all automorphisms of  $\mathbb{F}_{p(q^f-1)}$  over  $\mathbb{F}_{q^f-1}$ .

Let  $\alpha = \alpha(\chi_\lambda, \mathfrak{p})$  and let  $\beta = \alpha(\chi_\lambda^\ell, \mathfrak{p})$ . Then  $\ell\alpha = \beta + \nu(q-1)$  with  $\nu \geq 0$ . If  $0 \leq k < \ell$  let

$$\alpha(\mu_\kappa^k, \mathfrak{P}) = k \cdot \frac{q^f - 1}{\ell} = \sum_{j=0}^{f-1} \gamma_j^k q^j$$

with  $0 \leq \gamma_j^k \leq q-1$ . In particular,  $\gamma_0^k$  is the residue of  $k \cdot \frac{q^f-1}{\ell}$  modulo  $q$ . Moreover if  $k_1 \equiv q^i k$  (modulo  $\ell$ ) then

$$\alpha(\mu_\kappa^k, \mathfrak{P}) = \sum_{j=0}^{f-1} \gamma_{j+i}^{k_1} q^j.$$

It is understood that if  $j+i \geq \ell$  then  $\gamma_{j+i}^{k_1} = \gamma_{j+i-\ell}^{k_1}$ . Thus if  $\varphi(x)$  is the remainder of  $x$  upon division by  $q$ ,

$$\{\gamma_j^k | k \in A, 0 \leq j < f\} = \left\{ \varphi \left( k \cdot \frac{q^f-1}{\ell} \right) | 0 < k < \ell \right\}.$$

Certainly

$$\alpha(\chi_{\kappa/\lambda} \mu_\kappa^k, \mathfrak{P}) \equiv \frac{q^f-1}{q-1} \alpha + k \cdot \frac{q^f-1}{\ell} \pmod{(q^f-1)}.$$

Let  $0 \leq k' < \ell$  and let  $\nu + k \equiv k' \pmod{\ell}$ . Since, by definition,  $\ell\alpha = \beta + \nu(q-1)$

$$\frac{q^f - 1}{q - 1} \alpha + k \frac{q^f - 1}{\ell} \equiv \frac{q^f - 1}{\ell} \cdot \frac{\beta}{q - 1} + k' \frac{q^f - 1}{\ell} \pmod{(q^f - 1)}.$$

Since  $0 \leq \beta < q - 1$  the right side is non-negative and at most  $q^f - 2$ . Thus it is  $\alpha(\chi_{\kappa/\lambda} \mu_{\kappa}^k, \mathfrak{P})$ .

Let

$$\alpha(\chi_{\kappa/\lambda} \mu_{\kappa}^k, \mathfrak{P}) = \sum_{j=0}^{f-1} \delta_j^k q^j$$

with  $0 \leq \delta_j^k \leq q - 1$ . Thus  $\delta_0^k$  is the residue of

$$\frac{q^f - 1}{\ell} \cdot \frac{\beta}{q - 1} + k' \cdot \frac{q^f - 1}{\ell}$$

modulo  $q$ . Since  $\chi_{\kappa/\lambda}$  is invariant under automorphisms of  $\kappa/\lambda$

$$\alpha(\chi_{\kappa/\lambda} \mu_{\kappa}^k, \mathfrak{P}) = \sum_{j=0}^{f-1} \delta_{j+i}^{k_1} q^j$$

if  $k_1 \equiv q^i k \pmod{\ell}$ . Since the residue of  $\frac{q^f - 1}{q - 1} \alpha$  modulo  $q$  is  $\alpha$ ,

$$\{\alpha\} \cup \{\delta_j^k \mid 0 \leq j < \ell, k \in A\} = \left\{ \varphi \left( \frac{q^f - 1}{\ell} \cdot \frac{\beta}{q - 1} + k \frac{q^f - 1}{\ell} \right) \mid 0 \leq k < \ell \right\}.$$

Since  $\chi_{\lambda}(\ell^{\ell}) \equiv \ell^{\alpha\ell} \pmod{*}\mathfrak{P}$  the number  $\mu$  is multiplicatively congruent modulo  $\mathfrak{P}$  to the quotient of

$$\frac{\varpi^{\alpha} \varpi^{\varepsilon}}{\alpha! \prod_{k \in A} \prod_{j=0}^{\ell-1} \delta_j^k!}, \quad \varepsilon = \sum_{k \in A} \sum_{j=0}^{f-1} \delta_j^k$$

by

$$\frac{\ell^{\beta} \varpi^{\beta} \varpi^{\varepsilon'}}{\beta! \prod_{k \in A} \prod_{j=0}^{\ell-1} \gamma_j^k!}, \quad \varepsilon' = \sum_{k \in A} \sum_{j=0}^{f-1} \gamma_j^k.$$

Since

$$\sum_{j=0}^{f-1} (\alpha + \gamma_j^k) q^j \equiv \sum_{j=0}^{f-1} \delta_j^k q^j,$$

we conclude from Lemma 7.4 that

$$f\alpha + \sum_{j=0}^{f-1} (\gamma_j^k - \delta_j^k) = \rho(q-1),$$

if  $\rho$  is the number of  $i$ ,  $0 \leq i < f$ , such that

$$\frac{q^f - 1}{q - 1} \alpha + \alpha \left( \mu_\kappa^{\eta(q^i k)}, \mathfrak{P} \right) \geq q^f.$$

Since

$$\frac{q^f - 1}{q - 1} \cdot \alpha + \alpha(\mu_\kappa^0, \mathfrak{P}) = \frac{q^f - 1}{q - 1} \alpha,$$

the number

$$(\ell - 1)\alpha + \sum_{k \in A} \sum_{j=0}^{f-1} (\gamma_j^k - \delta_j^k)$$

is  $(q - 1)$  times the number of  $k$ ,  $0 \leq k < \ell$ , such that

$$\frac{q^f - 1}{q - 1} \alpha + k \cdot \frac{q^f - 1}{\ell} = \frac{q^f - 1}{q - 1} \frac{\beta}{\ell} + (k + \nu) \frac{q^f - 1}{\ell} \geq q^f.$$

The number of such  $k$  is  $\nu$  because  $\nu < \ell$  and

$$\frac{q^f - 1}{q - 1} \frac{\beta}{\ell} + (\ell - \nu + \nu) \frac{q^f - 1}{\ell} \geq 1 + q^f - 1 = q^f$$

while

$$\frac{q^f - 1}{q - 1} \frac{\beta}{\ell} + (\ell - 1) \frac{q^f - 1}{\ell} < \frac{q^f - 1}{\ell} + (\ell - 1) \frac{q^f - 1}{\ell} = q^f - 1.$$

Thus

$$\sum_{k \in A} \sum_{j=0}^{f-1} (\gamma_j^k - \delta_j^k) = \nu(q - 1) - (\ell - 1)\alpha = \alpha - \beta.$$

If  $\ell m \equiv 1 \pmod{q}$

$$\varphi \left( k \cdot \frac{q^f - 1}{\ell} \right) = \varphi(-km)$$

and

$$\varphi \left( \frac{q^f - 1}{\ell} \cdot \frac{\beta}{q - 1} + k \frac{q^f - 1}{\ell} \right) = \varphi((\beta - k)m).$$

It follows immediately from Lemma 7.5 that

$$\ell^\beta \alpha! \prod_{k \in A} \prod_{j=0}^{f-1} \delta_j^k! \equiv \beta! \prod_{k \in A} \prod_{j=0}^{f-1} \gamma_j^k!$$

Thus  $\mu = 1$  if  $q$  is odd and  $\mu = \pm 1$  if  $q$  is even. If  $\chi_\lambda = 1$  the number  $\mu$  is clearly 1. This time too, one can apply part (f) of Lemma 7.1 and induction on the number of primes dividing the order of  $\chi_\lambda$  to show that  $\mu = 1$  if  $q$  is even.

**Lemma 7.9**

Let  $\lambda$  be a finite field with  $q$  elements and let  $\kappa$  be a finite extension of  $\lambda$  with  $[\kappa : \lambda] = \ell$  where  $\ell$  is a prime dividing  $q - 1$ . Suppose  $\chi_\lambda$  is a character of  $\lambda^*$  whose restriction to the  $\ell$ th roots of unity is not trivial and  $\chi_\kappa$  is a character of  $\kappa^*$  such that  $\chi_\kappa^\ell = \chi_{\kappa/\lambda}$ . If  $T$  is the set of non-trivial characters of  $\lambda^*$  of order  $\ell$

$$\chi_\lambda(\ell) \tau(\chi_\lambda, \psi_\lambda) \prod_{\mu_\lambda \in T} \tau(\mu_\lambda, \psi_\lambda) = \tau(\chi_\kappa, \psi_{\kappa/\lambda}).$$

If  $\sigma \in \mathfrak{G}(\kappa/\lambda)$  define  $\chi_\kappa^\sigma$  by  $\chi_\kappa^\sigma(\alpha) = \chi_\kappa(\alpha^{\sigma^{-1}})$ . Since  $\chi_{\kappa/\lambda}^\sigma = \chi_{\kappa/\lambda}$ ,  $\chi_\kappa^{\sigma^\ell} = \chi_{\kappa/\lambda}$  and  $\chi_\kappa^{\sigma^{-1}}$  is a character of order  $\ell$ . If  $\chi_\kappa^{\sigma^{-1}} = 1$  for some  $\sigma \neq 1$  then it is 1 for all  $\sigma$  and  $\chi_\kappa(\alpha) = 1$  if  $\alpha$  is a  $(q - 1)$ th power, that is, if  $N_{\kappa/\lambda}(\alpha) = 1$ . Consequently there is a character  $\nu_\lambda$  of  $\lambda^*$  such that  $\chi_\kappa = \nu_{\kappa/\lambda}$ . Then  $\nu_\lambda^\ell = \chi_\lambda$  and  $\chi_\lambda$  is trivial on the  $\ell$ th roots of unity, contrary to assumption. Thus

$$\{\chi_\kappa^{\sigma^{-1}} \mid \sigma \neq 1\} = \{\mu_{\kappa/\lambda} \mid \mu_\lambda \in T\}.$$

If  $\beta \in \lambda^*$  and  $\beta = N_{\kappa/\lambda}(\gamma)$  then

$$\chi_\kappa(\beta) = \prod_{\sigma} \chi_\kappa(\gamma^{\sigma^{-1}}) = \chi_\kappa(\gamma^\ell) \prod_{\sigma \neq 1} \chi_\kappa^{\sigma^{-1}}(\gamma) = \chi_\lambda(\beta) \prod_{\sigma \neq 1} \mu_\lambda(\beta),$$

because  $\mu_\lambda(\beta) = \mu_{\kappa/\lambda}(\gamma)$ , and it will be enough to show that

$$\chi_\lambda(\ell) \tau(\chi_\lambda) \prod_{\mu_\lambda \in T} \tau(\mu_\lambda) = \tau(\chi_\kappa).$$

Let  $\mu$  be the quotient of the left side by the right. Thus  $\mu$  is a number in  $\mathfrak{K}_{p(q-1)}$  and the only primes appearing in the factorization of  $\mu$  are divisors of  $p$ . Since  $\chi_{\kappa/\lambda}$  is not identically 1 neither is  $\chi_\kappa$ . Thus the absolute value of  $\mu$  and all its conjugates is 1. Let  $\alpha = \alpha(\chi_\lambda, \mathfrak{p})$  and let  $\beta = \alpha(\chi_\kappa, \mathfrak{P})$  where  $\mathfrak{P}$  divides  $\mathfrak{p}$ . Then

$$\ell\beta \equiv \alpha \frac{q^\ell - 1}{q - 1} \pmod{(q^\ell - 1)}.$$

Since  $\ell$  divides  $\frac{q^\ell - 1}{q - 1}$  we can write

$$\beta = \frac{q^\ell - 1}{q - 1} \cdot \frac{\alpha}{\ell} - j \cdot \frac{q^\ell - 1}{\ell}.$$

Since the restriction of  $\chi_\lambda$  to the  $\ell$ th roots of unity is not trivial,  $\alpha \cdot \frac{q-1}{\ell} \not\equiv 0 \pmod{(q-1)}$ . Thus  $\ell$  does not divide  $\alpha$ . For all  $i \geq 0$

$$\tau(\chi_\kappa^{q^i}) = \tau(\chi_\kappa).$$

Moreover

$$\begin{aligned} \alpha(\chi_\kappa^{q^i}, \mathfrak{P}) &\equiv \frac{\alpha^\ell - 1}{q-1} \frac{\alpha}{\ell} - j \frac{\alpha^\ell - 1}{\ell} + (q^i - 1) \frac{q^\ell - 1}{q-1} \frac{\alpha}{\ell} - j(q^i - 1) \frac{q^\ell - 1}{\ell} \\ &\equiv \frac{q^\ell - 1}{q-1} \frac{\alpha}{\ell} + \left\{ \frac{q^i - 1}{q-1} \alpha - j \right\} \frac{q^\ell - 1}{\ell}. \end{aligned}$$

Since  $\frac{q^i - 1}{q-1} \equiv i \pmod{\ell}$  we choose  $i$  so that  $i\alpha \equiv j \pmod{\ell}$ ; then

$$\alpha(\chi_\kappa^{q^i}, \mathfrak{P}) \equiv \frac{q^\ell - 1}{q-1} \frac{\alpha}{\ell} \pmod{(q^\ell - 1)}.$$

Both sides of this congruence are non-negative and less than  $q^\ell - 1$ . Thus it is an equality and we can assume that  $\beta = \frac{q^\ell - 1}{q-1} \cdot \frac{\alpha}{\ell}$ . The set  $T$  consists of the characters  $\mu_\lambda^j$ ,  $1 \leq j \leq \ell - 1$ , defined by

$$\alpha(\mu_\lambda^j, \mathfrak{P}) = \frac{j}{\ell} (q-1).$$

Under the automorphism  $z \rightarrow z^m$  of  $k_{p(q^\ell - 1)}$  over  $k_{q^\ell - 1}$  the number  $\mu$  is multiplied by  $\chi_\kappa^{-1}(m) \chi_\lambda(m) \prod_{\mu_\lambda \in T} \mu_\lambda(m)$  which is 1 because  $m$  belongs to  $\lambda$ . Let

$$\beta = \gamma_0 + \gamma_1 q + \dots + \gamma_{\ell-1} q^{\ell-1}$$

with  $0 \leq \gamma_i \leq q-1$ . Then

$$\tau(\chi_\kappa) \equiv \frac{\varpi^\varepsilon}{\prod_{j=0}^{\ell-1} \gamma_j!} \pmod{* \mathfrak{P}}, \quad \varepsilon = \sum_{j=0}^{\ell-1} \gamma_j,$$

and

$$\chi_\lambda(\ell) \tau(\chi_\lambda) \prod_{j=1}^{\ell-1} \tau(\mu_\lambda^j) \equiv \frac{\ell^\alpha \varpi^{\varepsilon'}}{\alpha! \prod_{j=1}^{\ell-1} (j \cdot \frac{q-1}{\ell})!} \pmod{* \mathfrak{P}}, \quad \varepsilon' = \alpha + \sum_{j=0}^{\ell-1} j \cdot \frac{q-1}{\ell}.$$

Lemma 7.6 implies immediately that  $\mu \equiv 1 \pmod{* \mathfrak{P}}$ . Thus  $\mu = 1$  if  $q$  is odd and  $\mu = \pm 1$  if  $q$  is even. If  $\ell'$  is a prime divisor of  $q-1$  different from  $\ell$ , we write  $\chi_\lambda$  as  $\chi'_\lambda \chi''_\lambda$  where the order of

$\chi'_\lambda$  is a power of  $\ell'$  and the order of  $\chi''_\lambda$  is prime to  $\ell$ . In a similar fashion we write  $\chi_\kappa$  as  $\chi'_\kappa \chi''_\kappa$ . The pair  $\chi''_\lambda$  and  $\chi''_\kappa$  also satisfy the conditions of the lemma. The final assertion of Lemma 7.1 shows that, if  $\mu''$  is defined in the same way as  $\mu$ ,  $\mu = \mu''$ . Arguing by induction we see that it is enough to verify that  $\mu = 1$  when the order of  $\chi_\lambda$  is a power of  $\ell$ . Applying the last part of Lemma 7.1, again we see that there is a prime  $\mathfrak{q}$  dividing  $\ell$  such that

$$\tau(\chi_\lambda) \equiv \tau(\chi_\kappa) \equiv \tau(\mu_\lambda^j) \equiv 1 \pmod{\mathfrak{q}}.$$

Since  $\chi_\lambda(\ell)$  is an  $\ell^\omega$ th root of unity for some  $\omega$ ,

$$\chi_\lambda(\ell) \equiv 1 \pmod{\mathfrak{q}}.$$

Thus  $\mu \equiv 1 \pmod{\ell}$  and  $\mu = 1$ .

## Chapter Eight.

### A Lemma of Lamprecht

Let  $F$  be a non-archimedean local field and let  $\psi_F$  be a non-trivial character of  $F$ .  $n = n(\psi_F)$  is the largest integer such that  $\psi_F$  is trivial on  $\mathfrak{P}_F^{-n}$ . If  $\chi_F$  is a quasi-character of  $C_F$ ,  $m = m(\chi_F)$  is the smallest non-negative integer such that  $\chi_F$  is trivial on  $U_F^m$ . If  $\gamma$  in  $C_F$  is such that  $\gamma O_F = \mathfrak{P}_F^{m+n}$  set

$$\Delta_1(\chi_F, \psi_F; \gamma) = \frac{\int_{U_F} \psi_F \left( \frac{\alpha}{\gamma} \right) \chi_F^{-1}(\alpha) d\alpha}{\left| \int_{U_F} \psi_F \left( \frac{\alpha}{\gamma} \right) \chi_F^{-1}(\alpha) d\alpha \right|}.$$

Then

$$\Delta(\chi_F, \psi_F) = \chi_F(\gamma) \Delta_1(\chi_F, \psi_F, \gamma).$$

As suggested by Hasse [8], we shall, in the proofs, of the main lemmas, make extensive use of the following lemma which is central to the paper [10] of Lamprecht.

#### Lemma 8.1

(a) If  $m = m(\chi_F) = 2d$  with  $d$  integral and positive there is a unit  $\beta$  in  $O_F$  such that

$$\psi_F \left( \frac{\beta x}{\gamma} \right) = \chi_F(1 + x)$$

for all  $x$  in  $\mathfrak{P}_F^d$ . For any such  $\beta$

$$\Delta_1(\chi_F, \psi_F; \gamma) = \psi_F \left( \frac{\beta}{\gamma} \right) \chi_F^{-1}(\beta).$$

(b) If  $m = m(\chi_F) = 2d + 1$  with  $d$  integral and positive there is a unit  $\beta$  in  $O_F$  such that, for all  $x$  in  $\mathfrak{P}_F^{d+1}$ ,

$$\psi_F \left( \frac{\beta x}{\gamma} \right) = \chi_F(1 + x).$$

For any such  $\beta$ ,  $\Delta_1(\chi_F, \psi_F; \gamma)$  is equal to

$$\psi_F \left( \frac{\beta}{\gamma} \right) \chi_F^{-1}(\beta) \frac{\int_{O_F/\mathcal{P}_F} \psi_F \left( \frac{\delta \beta x}{\gamma} \right) \chi_F^{-1}(1 + \delta x) dx}{\left| \int_{O_F/\mathcal{P}_F} \psi_F \left( \frac{\delta \beta x}{\gamma} \right) \chi_F^{-1}(1 + \delta x) dx \right|}$$

if  $\delta O_F = \mathfrak{P}_F^d$ .

Let  $m = 2d + \varepsilon$  with  $\varepsilon = 0$  in case (a) and  $\varepsilon = 1$  in case (b). The function  $\psi_F \left( \frac{xy}{\gamma} \right)$ ,  $x \in O_F$ ,  $y \in \mathfrak{P}_F^{d+\varepsilon}$  can be regarded as a function on

$$O_F / \mathfrak{P}_F^d \times \mathfrak{P}_F^{d+\varepsilon} / \mathfrak{P}_F^m.$$

For fixed  $x$  it is a character of  $\mathfrak{P}_F^{d+\varepsilon} / \mathfrak{P}_F^m$  which is trivial if and only if  $x \in \mathfrak{P}_F^d$  and for fixed  $y$  it is a character of  $O_F / \mathfrak{P}_F^d$  which is trivial if and only if  $y \in \mathfrak{P}_F^m$ . Thus it defines a duality of  $O_F / \mathfrak{P}_F^d$  and  $\mathfrak{P}_F^{d+\varepsilon} / \mathfrak{P}_F^m$ . The existence of a  $\beta$  such that

$$\chi_F(1+x) = \psi_F \left( \frac{\beta x}{\gamma} \right)$$

for  $x$  in  $\mathfrak{P}_F^{d+\varepsilon}$  follows immediately from the relation

$$\chi_F(1+x) \chi_F(1+y) = \chi_F(1+x+y)$$

which is valid for  $x$  in  $\mathfrak{P}_F^{d+\varepsilon}$ . The number  $\beta$  must be a unit because  $\chi_F(1+x)$  is different from 1 for some  $x$  in  $\mathfrak{P}_F^{m-1}$ .

In case (a)

$$\int_{U_F} \psi_F \left( \frac{\alpha}{\gamma} \right) \chi_F^{-1}(\alpha) d\alpha$$

is equal to

$$\int_{U_F / U_F^d} \psi_F \left( \frac{\alpha}{\gamma} \right) \chi_F^{-1}(\alpha) \left\{ \int_{\mathfrak{P}_F^d} \psi_F \left( \frac{(\alpha - \beta)x}{\gamma} \right) dx \right\} d\alpha.$$

The main integral is 1 or 0 according as  $\alpha - \beta$  does or does not lie in  $\mathfrak{P}_F^d$ . Thus this expression is equal to

$$\psi_F \left( \frac{\beta}{\gamma} \right) \chi_F^{-1}(\beta) [U_F : U_F^d]^{-1}.$$

The first part of the lemma follows.

In case (b)

$$\int_{U_F} \psi_F \left( \frac{\alpha}{\gamma} \right) \chi_F^{-1}(\alpha) d\alpha$$

is equal to

$$\int_{U_F / U_F^{d+1}} \psi_F \left( \frac{\alpha}{\gamma} \right) \chi_F^{-1}(\alpha) \left\{ \int_{\mathfrak{P}_F^{d+1}} \psi_F \left( \frac{(\alpha - \beta)x}{\gamma} \right) dx \right\} d\alpha.$$

The inner integral is 0 unless  $\alpha - \beta$  lies in  $\mathcal{P}_F^d$  when it is 1. Thus this expression is equal to

$$\psi_F \left( \frac{\beta}{\gamma} \right) \chi_F^{-1}(\beta) [U_F : U_F^d]^{-1} \int_{O_F/\mathfrak{P}_F} \psi_F \left( \frac{\delta\beta x}{\gamma} \right) \chi_F^{-1}(1 + \delta x) dx.$$

The second part of the lemma follows.

The number  $\beta$  is only determined modulo  $\mathfrak{P}_F^d$ . When applying the lemma we shall, after choosing  $\beta$ , set

$$\Delta_2(\chi_F, \psi_F; \gamma) = \psi_F \left( \frac{\beta}{\gamma} \right) \chi_F^{-1}(\beta)$$

and then define  $\Delta_3(\chi_F, \psi_F; \gamma)$ , which will be 1 when  $m$  is even, by the equation,

$$\Delta_1(\chi_F, \psi_F; \gamma) = \Delta_2(\chi_F, \psi_F; \gamma) \Delta_3(\chi_F, \psi_F; \gamma).$$

When we need to make the relation between  $\beta$  and  $\chi_F$  explicit we write  $\beta$  as  $\beta(\chi_F)$ . To be of any use to us this lemma must be supplemented by some other observations.

If  $K$  is a finite Galois extension of  $F$  any quasi-character  $\chi_F$  of  $C_F$  determines a one-dimensional representation of  $W_{K/F}$  whose restriction to  $C_K$  is a quasi-character  $\chi_{K/F}$  of  $C_K$ . The character  $\chi_{K/F}$  may be defined directly by

$$\chi_{K/F}(\alpha) = \chi_F(N_{K/F}\alpha).$$

More generally, if  $E$  is any finite separable extension of  $F$  we define  $\chi_{E/F}$  by

$$\chi_{E/F}(\alpha) = \chi_F(N_{E/F}\alpha).$$

To apply the lemma of Lamprecht we shall need to know, in some special cases, the relation between  $\beta(\chi_F)$  and  $\beta(\chi_{E/F})$ .

Suppose  $m$  is a positive integer and  $m = 2d + \varepsilon$  where  $\varepsilon$  is 0 or 1 and  $d$  is a positive integer. Let  $m' = \psi_{E/F}(m - 1) + 1$  and let  $m' = 2d' + \varepsilon'$  where  $\varepsilon'$  is 0 or 1 and  $d'$  is a positive integer.\* Since  $\psi_{E/F}$  is convex

$$\psi_{E/F} \left( \frac{m-1}{2} \right) \leq \frac{1}{2} \psi_{E/F}(m-1) + \frac{1}{2} \psi_{E/F}(0) = \frac{1}{2} (m' - 1) < d' + \varepsilon'$$

---

\* We are here dealing not with an additive character, but with the function of Chapter 6!

and

$$d' + \varepsilon' = \psi_{E/F}(u)$$

with  $u > \frac{m-1}{2}$ . Since the least integer greater than  $\frac{m-1}{2}$  is  $d + \varepsilon$ , Lemma 6.6 implies that

$$N_{E/F} \left( U_E^{d'+\varepsilon'} \right) \leq U_F^u \leq U_F^{d+\varepsilon}.$$

In other words, if  $x \in \mathfrak{P}_E^{d'+\varepsilon'}$  then

$$N_{E/F}(1+x) - 1 \in \mathfrak{P}_F^{d+\varepsilon}.$$

Lemma 6.6 also implies that

$$N_{E/F}(1+x) - 1 \in \mathfrak{P}_F^m$$

if  $x \in \mathfrak{P}_E^{m'}$ . If  $x \in \mathfrak{P}_E^{d'+\varepsilon'}$  and  $y \in \mathfrak{P}_E^{m'}$  then

$$N_{E/F}(1+x+y) - 1 = N_{E/F}(1+x)N_{E/F} \left( 1 + \frac{y}{1+x} \right) - 1$$

is congruent to

$$N_{E/F}(1+x) - 1$$

modulo  $\mathfrak{P}_F^m$ . Thus if  $x \in \mathfrak{P}_E^{d'+\varepsilon'}$  and  $y \in \mathfrak{P}_E^{d'+\varepsilon'}$  so that  $xy \in \mathfrak{P}_E^{m'}$ , then

$$N_{E/F}(1+x+y) - 1 \equiv N_{E/F}(1+x+y+xy) - 1 \pmod{\mathfrak{P}_F^m}.$$

The right side is

$$N_{E/F}(1+x)N_{E/F}(1+y) - 1,$$

which equals

$$\{N_{E/F}(1+x) - 1\} + \{N_{E/F}(1+y) - 1\} + \{(N_{E/F}(1+x) - 1)(N_{E/F}(1+y) - 1)\}$$

and this is congruent to

$$\{N_{E/F}(1+x) - 1\} + \{N_{E/F}(1+y) - 1\}$$

modulo  $\mathfrak{P}_F^m$ . Thus the map

$$P_{E/F} : x \longrightarrow N_{E/F}(1+x) - 1$$

is a homomorphism from  $\mathfrak{P}_E^{d'+\varepsilon'}/\mathfrak{P}_E^{m'}$  to  $\mathfrak{P}_F^{d+\varepsilon}/\mathfrak{P}_F^m$ . If  $E \subseteq E'$  we can replace  $F$  by  $E$ ,  $E$  by  $E'$ ,  $m$  by  $m'$ , and  $m'$  by  $\psi_{E'/E}(m' - 1) + 1$ , and define  $P_{E'/E}$ . Since  $\psi_{E'/F} = \psi_{E'/E} \circ \psi_{E/F}$  and

$$N_{E'/F}(1+x) - 1 = N_{E/F}(1 + (N_{E'/E}(1+x) - 1)) - 1,$$

the relation

$$P_{E'/F} = P_{E/F} \circ P_{E'/E}$$

is valid.

If  $n = n(\psi_F)$  and  $n' = n(\psi_{E/F})$ , choose  $\gamma_F$  in  $C_F$  so that  $\gamma_F O_F = \mathfrak{P}_F^{m+n}$  and  $\gamma_E$  in  $C_E$  so that  $\gamma_E O_E = \mathfrak{P}_E^{m'+n'}$ . I apologize again for the unfortunate conflict of notation.  $\psi_{E/F}$  is on the one hand a function on  $\{u \in \mathbb{R} \mid u \geq -1\}$  and on the other a character of  $E$ . However, warned one again, the reader should not be too inconvenienced by the conflict. Define

$$P_{E/F}^* : O_F/\mathfrak{P}_F^d \longrightarrow O_E/\mathfrak{P}_E^{d'}$$

by the relation

$$\psi_F \left( \frac{x P_{E/F}(y)}{\gamma_F} \right) = \psi_{E/F} \left( \frac{P_{E/F}^*(x)y}{\gamma_E} \right).$$

It will often be necessary to keep in mind the dependence of  $P_{E/F}^*$  on  $\gamma_F$  and  $\gamma_E$ . Then we shall write

$$P_{E/F}^*(x) = P_{E/F}^*(x; \gamma_E, \gamma_F).$$

It is clear that

$$P_{E'/F}^*(x; \gamma_{E'}, \gamma_F) = P_{E'/E}^*(P_{E/F}^*(x; \gamma_E, \gamma_F); \gamma_{E'}, \gamma_E).$$

## Lemma 8.2

Let  $K/F$  be abelian and let  $G = \mathfrak{G}(K/F)$ . Suppose there is an integer  $t$  such that  $G = G_t$  while  $G_{t+1} = \{1\}$ . Suppose  $m \geq t+1$  and  $m > 1$  and  $\gamma_F$  is chosen. If  $\mu_F$  belongs to  $S(K/F)$ , the set of characters of  $C_F/N_{K/F}C_K$ , then  $m \geq m(\mu_F)$  so that for some  $\alpha(\mu_F)$  in  $O_F$

$$\mu_F(1+x) = \psi_F \left( \frac{\alpha(\mu_F)x}{\gamma_F} \right)$$

for all  $x$  in  $\mathfrak{P}_F^{d+\varepsilon}$ . The element  $\gamma_K$  may be taken equal to  $\gamma_F$  and if  $P_{K/F}^*(\beta) = P_{K/F}^*(\beta; \gamma_F, \gamma_F)$  then

$$N_{K/F}(P_{K/F}^*(\beta)) \equiv \prod_{\mu_F} (\beta + \alpha(\mu_F)) \pmod{\mathfrak{P}_F^d}$$

for all  $\beta$  in  $O_F$ .

If  $t = -1$  then  $n(\psi_F) = n(\psi_{K/F})$  and  $m' = m$  so that  $\gamma_K$  may be taken equal to  $\gamma_F$ . If  $t \geq 0$  the extension is ramified. Let  $\mathfrak{P}_K^{\delta_{K/F}}$  be the different of  $K/F$ . Then

$$n(\psi_{K/F}) = [K : F]n(\psi_F) + \delta_{K/F}.$$

By definition

$$\psi_{K/F}(m-1) = t + [K : F](m-t-1).$$

By Proposition 4 of paragraph IV.2 of Serre's book  $\delta_{K/F} = ([K : F] - 1)(t + 1)$ . Thus

$$m^* + n(\psi_{K/F}) = [K : F](m + n(\psi_F))$$

and we can again take  $\gamma_K = \gamma_F$ .

Since  $m(\mu_F) = t + 1$  we have  $m \geq m(\mu_F)$  and

$$\mu_F(1+x+y) = \mu_F(1+x)\mu_F(1+y)$$

for  $x$  and  $y$  in  $\mathfrak{P}_F^{d+\varepsilon}$ . Thus the existence of  $\alpha(\mu_F)$  is assured. The last assertion of the lemma will be proved by induction. We will need to know that if  $x \equiv y \pmod{\mathfrak{P}_K^{d'}}$  then

$$N_{K/F}x \equiv N_{K/F}y \pmod{\mathfrak{P}_F^d}.$$

When proving this we may suppose that  $xO_K = \mathfrak{P}_K^r$  with  $r \leq d'$  and that  $\frac{y}{x}$  belongs to  $O_K$ . Then

$$N_{K/F}x - N_{K/F}y = N_{K/F}x \left\{ 1 - N_{K/F} \left( 1 + \frac{y-x}{x} \right) \right\}.$$

If  $r \geq d$  there is nothing to prove. Suppose  $r \leq d$ . If  $d' - r = \psi_{K/F}(u)$  and  $s$  is the smallest integer greater than or equal to  $u$  the right side belongs to  $\mathfrak{P}_F^{s+r}$ . Since the derivative of  $\psi_{K/F}$  is at least one everywhere  $\psi_{K/F}(u+r) \geq d'$ . But

$$d' \geq \frac{m'-1}{2} = \frac{1}{2} \psi_{K/F}(m-1) + \frac{1}{2} \psi_{K/F}(0) \geq \psi_{K/F} \left( \frac{m-1}{2} \right).$$

Thus  $u+r \geq \frac{m-1}{2}$  and  $s+r \geq d$ .

Suppose  $F \subseteq L \subseteq K$  and  $L/F$  is cyclic of prime order. Let  $H = \mathfrak{G}(K/L)$  and let  $\overline{G} = \mathfrak{G}(L/F)$ . Certainly  $H = H_t$  while  $H_{t+1} = \{1\}$ . Since  $\psi_{K/F}(t) = \psi_{K/L}(t) = t$ , we have  $\psi_{L/F}(t) = t$  and, by Herbrand's theorem,

$$\overline{G}_t = \overline{G}^t = HG^t/H = G/H = \overline{G}.$$

Moreover  $t + 1 = \psi_{L/F}(t + \delta)$  with  $\delta > 0$  so that

$$\overline{G}_{t+1} = \overline{G}^{t+\delta} = HG^{t+\delta}/H = H/H = \{1\}.$$

Finally,  $\psi_{L/F}(m - 1) + 1 \geq t + 1$  so that  $L/F$  and  $K/L$ , with  $m$  replaced by  $\psi_{L/F}(m - 1) + 1$ , satisfy the conditions of the lemma.  $S(L/F)$  is a subgroup of  $S(K/F)$ . If  $\mu_F$  and  $\nu_F$  belong to  $S(K/F)$  then  $\mu_{L/F} = \nu_{L/F}$  if and only if  $\mu_F$  and  $\nu_F$  belong to the same coset of  $S(L/F)$ . Take  $S$  to be a set of representatives for these cosets; then

$$S(K/L) = \{\mu_{L/F} \mid \mu_F \mid \mu_F \in S\}.$$

We take  $\alpha(\mu_F \nu_F) = \alpha(\mu_F) + \alpha(\nu_F)$  if  $\mu_F$  belongs to  $S$  and  $\nu_F$  belongs to  $S(L/F)$ . If  $\mu_F$  belongs to  $S$  we take  $\alpha(\mu_{L/F})$  to be  $P_{L/F}^*(\alpha(\mu_F))$ . If the lemma is valid for  $K/L$  and  $L/F$  then

$$N_{K/F}(P_{K/F}^*(\beta)) = N_{L/F}(N_{K/L}(P_{K/L}^*(P_{L/F}^*(\beta))))$$

which is congruent modulo  $\mathcal{P}_F^d$  to

$$N_{L/F} \left( \prod_{\mu_F \in S} (P_{L/F}^*(\beta) + P_{L/F}^*(\alpha(\mu_F))) \right)$$

or

$$\prod_{\mu_F \in S} \{N_{L/F}(P_{L/F}^*(\beta + \alpha(\mu_F)))\}.$$

This is congruent modulo  $\mathcal{P}_F^d$  to

$$\prod_{\mu_F \in S} \prod_{\nu_F \in S(L/F)} \{\beta + \alpha(\mu_F) + \alpha(\nu_F)\}$$

which equals

$$\prod_{\mu_F \in S(K/F)} \{\beta + \alpha(\mu_F)\}.$$

Thus it is enough to prove the lemma when  $K/F$  is cyclic of prime order. In this case more precise information is needed and the assertion of the lemma will follow immediately from it.

### Lemma 8.3

If  $K/F$  is unramified and  $m \geq 1$  we may take  $P_{K/F}^*(\beta) = \beta$ .

According to paragraph V.2 of Serre's book

$$N_{K/F}(1 + y) - 1 \equiv S_{K/F}(y) \pmod{\mathcal{P}_F^m}$$

if  $y \in \mathfrak{P}_K^{d'+\varepsilon'}$ . Thus  $P_{K/F}(y) = S_{K/F}(y)$  and

$$\psi_F \left( \frac{x P_{K/F} y}{\gamma_F} \right) = \psi_{K/F} \left( \frac{xy}{\gamma_F} \right).$$

#### Lemma 8.4

Suppose  $K/F$  is abelian, totally ramified, and  $[K : F] = \ell$  is an odd prime. If  $d \geq t + 1$  we may take  $P_{K/L}^*(\beta) = \beta$ .

The relation

$$m' = t + 1 + \ell(m - 1 - t) = \ell m - (t + 1)(\ell - 1)$$

implies that  $m' \equiv m \pmod{2}$ ,  $\varepsilon' = \varepsilon$ , and

$$d' = \ell d + \frac{\ell - 1}{2}(\varepsilon - t - 1) = d + \frac{\ell - 1}{2}(m - t - 1).$$

Since

$$\frac{\ell - 1}{2}(m - t - 1) \geq m - t - 1 \geq d + \varepsilon$$

we have

$$d' + \varepsilon' \geq 2(d + \varepsilon) \geq m.$$

Moreover

$$\frac{2(d' + \varepsilon') + \delta_{K/F}}{\ell} \geq \frac{m' + \delta_{K/F}}{\ell} = m$$

so that by Lemma 5 of paragraph V.3 of Serre's book

$$N_{K/F}(1 + x) - 1 \equiv S_{K/F}(x) \pmod{\mathfrak{P}_F^m}$$

if  $x \in \mathfrak{P}_K^{d'+\varepsilon'}$ . The lemma follows.

Let  $p$  be the characteristic of  $O_F/\mathfrak{P}_F$ .

#### Lemma 8.5

Suppose  $K/F$  is abelian, totally ramified, and  $[K : F] = \ell$  is an odd prime. Suppose  $t + 1 \leq m \leq 2t + 1$ . Choose a non-trivial character  $\mu_F$  in  $S(K/F)$ . We may choose  $\alpha = \alpha(\mu_F)$  so that  $\alpha O_F = \mathfrak{P}_F^v$ , if  $m = t + 1 + v$ , so that  $\alpha = N_{K/F}\alpha_1$  for some  $\alpha_1$  in  $O_K$ , and so that

$$\mu_F(1 + x) = \psi_F \left( \frac{\alpha x}{\gamma_F} \right)$$

for  $x$  in  $\mathfrak{P}_F^s$ . Here  $s$  is the least integer greater than or equal to  $\frac{t}{2}$ . If  $\zeta$  is a  $(p-1)$ th root of unity in  $F$  there is a unique integer  $j$  with  $1 \leq j \leq p-1$  such that  $\zeta - j$  lies in  $\mathfrak{P}_F$ . Set  $\mu_F^\zeta = \mu_F^j$ . We may take  $\alpha(\mu_F^\zeta)$  to be  $\zeta\alpha$ . If  $\beta$  belongs to  $O_F$  we can find a  $\beta_1$  in  $O_K$  such that  $\beta \equiv N_{K/F}\beta_1 \pmod{\mathfrak{P}_F^d}$ . Then

$$P_{K/F}^*(\beta) \equiv \beta - \beta_1 \frac{\alpha}{\alpha_1} \pmod{\mathfrak{P}_K^{d'}}.$$

If

$$\mu_F(1+x) = \psi_F \left( \frac{\alpha x}{\gamma_F} \right)$$

for  $x$  in  $\mathfrak{P}_F^s$  then, necessarily,  $\alpha O_F = \mathfrak{P}_F^v$ . Choose  $\delta_1$  in  $O_K$  such that  $\delta_1 O_K = \mathfrak{P}_K^v$  and set  $\delta = N_{K/F}\delta_1$ . Set  $\alpha = \omega\delta$  where  $\omega$  is yet to be chosen. We must have

$$\mu_F(1+x) = \psi_F \left( \frac{\omega\delta x}{\gamma_F} \right)$$

if  $x \in \mathfrak{P}_F^s$ . This equation determines the unit  $w$  modulo  $\mathfrak{P}_F^r$  if  $r = t - s$ . Since any unit is a norm modulo  $\mathfrak{P}_F^t$  we may suppose  $\omega = N_{K/F}\omega_1$ . Take  $\alpha_1 = \omega_2\delta_1$ .  $\beta_1$  exists for a similar reason.

The number  $\zeta - j$  must lie in  $pO_F$ . But  $K/F$  is wildly ramified, because  $2t+1 \geq m > 1$ ,  $\ell = p$  and  $p = S_{K/F}(1)$  so that, by paragraph V.3 of Serre's book,  $p$  belongs to  $\mathfrak{P}_F^u$  if  $u$  is the greatest integer in

$$\frac{(\ell-1)}{\ell} (t+1) \geq \frac{t+1}{2}.$$

However  $d + \varepsilon \geq s$  so that  $d + \varepsilon + u \geq t+1$  and, if  $x$  belongs to  $\mathfrak{P}_F^{d+\varepsilon}$ ,  $(\zeta - j)x$  lies in  $\mathfrak{P}_F^{t+1}$ . Thus

$$\psi_F \left( \frac{\alpha(\zeta - j)x}{\gamma_F} \right) = \mu_F(1 + (\zeta - j)x) = 1$$

and

$$\mu_F^j(1+x) = \mu_F^j(1+x) = \psi_F \left( \frac{j\alpha x}{\gamma_F} \right) = \psi_F \left( \frac{\zeta\alpha x}{\gamma_F} \right).$$

Since

$$\frac{2s + \delta_{K/F}}{\ell} \geq \frac{t+1 + \delta_{K/F}}{\ell} = t+1.$$

The lemmas of paragraph V.3 of Serre's book imply that

$$N_{K/F}(1+x) \equiv 1 + S_{K/F}(x) + N_{K/F}(x) \pmod{\mathfrak{P}_F^{t+1}}$$

if  $x$  belongs to  $\mathfrak{P}_K^s$  and then

$$1 = \mu_F(N_{K/F}(1+x)) = \mu_F(1 + S_{K/F}(x) + N_{K/F}(x)).$$

As we observed  $d + \varepsilon \geq s$ . Moreover  $d + \varepsilon \leq t + 1$  so that

$$\frac{d + \varepsilon + \delta_{K/F}}{\ell} \geq d + \varepsilon$$

and  $S_{K/F}(x)$  and  $N_{K/F}(x)$  belong to  $\mathfrak{P}_F^{d+\varepsilon}$  if  $x$  belongs to  $\mathfrak{P}_K^{d+\varepsilon}$ . Thus, for such  $x$ ,

$$\psi_F \left( \frac{\alpha N_{K/F}(x)}{\gamma_F} \right) = \psi_F \left( \frac{-\alpha S_{K/F}(x)}{\gamma_F} \right).$$

Again

$$\frac{2(d' + \varepsilon') + \delta_{K/F}}{\ell} \geq m$$

so that

$$N_{K/F}(1+x) - 1 = S_{K/F}(x) + N_{K/F}(x) \pmod{\mathfrak{P}_F^m}$$

if  $x \in \mathfrak{P}_K^{d'+\varepsilon'}$ . Moreover

$$d' + \varepsilon' = d + \varepsilon + \frac{\ell - 1}{2} (m - t - 1) \geq d + \varepsilon$$

so that  $N_{K/F}(x)$  and hence  $S_{K/F}(x)$  belong to  $\mathfrak{P}_F^{d+\varepsilon}$ . Thus

$$\beta N_{K/F}x \equiv \alpha N_{K/F} \left( \frac{\beta_1 x}{\alpha_1} \right) \pmod{\mathfrak{P}_F^m}.$$

But  $\beta_1 x / \alpha_1$  belongs to  $\mathfrak{P}_K^{d'+\varepsilon'-v}$  and

$$d' + \varepsilon' - v = d + \varepsilon + \frac{\ell - 1}{2} v - v \geq d + \varepsilon$$

so that

$$\psi_F \left( \frac{\beta P_{K/F}(x)}{\gamma_F} \right) = \psi_F \left( \frac{\beta S_{K/F}(x) + \beta N_{K/F}(x)}{\gamma_F} \right)$$

which equals

$$\psi_F \left( \frac{\beta S_{K/F}(x) - \alpha S_{K/F} \left( \frac{\beta_1 x}{\alpha_1} \right)}{\gamma_F} \right) = \psi_{K/F} \left( \left( \beta - \frac{\alpha \beta_1}{\alpha_1} \right) \frac{x}{\gamma_F} \right)$$

as required.

**Lemma 8.6**

Suppose  $K/F$  is a wildly ramified quadratic extension,  $m \geq t + 1$ , and  $m = t + 1 + v$ . Let  $\mu_F$  be the non-trivial character in  $S(K/F)$ . If  $\beta$  belongs to  $O_F$  there is a  $\beta_1$  in  $O_K$  and a  $\delta$  in  $U_F^t$  such that  $\beta \equiv \delta N_{K/F} \beta_1 \pmod{\mathfrak{P}_F^d}$ . We can choose  $\alpha = \alpha(\mu_F)$  so that

$$\mu_F(1 + x) = \psi_F \left( \frac{\alpha \delta x}{\gamma_F} \right)$$

if  $x$  is in  $\mathfrak{P}_F^s$  and so that  $\alpha = N_{K/F} \alpha_1$  for some  $\alpha_1$  in  $O_K$ . Here  $s$  has the same meaning as before. Thus, if  $r$  is the integral part of  $\frac{t+1}{2}$ ,  $t + 1 = r + s$ . With these choices

$$P_{K/F}^*(\beta) \equiv \beta - \frac{\beta_1 \alpha \delta}{\alpha_1} \pmod{\mathcal{P}_K^{d'}}.$$

If  $\beta = 0$  the existence of  $\delta$  and  $\beta_1$  is clear. Otherwise we can find a  $\beta_1$  such that  $N_{K/F} \beta_1 / \beta$  is in  $U_F^t$ . We choose  $\delta$  accordingly. If  $m = t + 1 + v$  and

$$\mu_F(1 + x) = \psi_F \left( \frac{\alpha \delta x}{\gamma_F} \right)$$

for  $x$  in  $\mathfrak{P}_F^s$  then  $O_F \alpha = \mathfrak{P}_F^v$ . Choose  $\eta_1$  in  $O_K$  so that  $O_K \eta_1 = \mathfrak{P}_K^v$  and set  $\eta = N_{K/F} \eta_1$ . Set  $\alpha = \omega \eta$  where  $\omega$  is yet to be chosen. We must have

$$\mu_F(1 + x) = \psi_F \left( \frac{\omega \eta \delta x}{\gamma_F} \right)$$

if  $x \in \mathfrak{P}_F^s$ . This equation determines the unit  $\omega$  modulo  $\mathfrak{P}_F^r$ . Since any unit is a norm modulo  $\mathfrak{P}_F^t$  we may suppose  $\omega = N_{K/F} \omega_1$ . Take  $\alpha_1 = \omega_1 \eta_1$ .

Since the extension is quadratic

$$N_{K/F}(1 + x) = 1 + S_{K/F}(x) + N_{K/F}(x).$$

Since

$$\frac{s + \delta_{K/F}}{2} = \frac{s + t + 1}{2} \geq s$$

both  $S_{K/F}(x)$  and  $N_{K/F}(x)$  are in  $\mathfrak{P}_F^s$  if  $x$  belongs to  $\mathfrak{P}_K^s$  and

$$\psi_F \left( \frac{\alpha \delta N_{K/F}(x)}{\gamma_F} \right) = \psi_F \left( \frac{-\alpha \delta S_{K/F}(x)}{\gamma_F} \right).$$

We have  $m' = 2m - (t + 1)$  and  $d' = m - s$ , so that  $d' + \varepsilon' = m - r$  and  $d' + \varepsilon' - v = s$ . Thus if  $x$  belongs to  $\mathfrak{P}_K^{d'+\varepsilon'}$

$$\beta N_{K/F}(x) \equiv \alpha \delta N_{K/F} \left( \frac{\beta_1 x}{\alpha_1} \right) \pmod{\mathfrak{P}_F^m}$$

and  $\beta_1 x / \alpha_1$  lies in  $\mathfrak{P}_K^s$ . Consequently

$$\psi_F \left( \frac{\beta P_{K/F} x}{\gamma_F} \right) = \psi_{K/F} \left( \left( \beta - \beta_1 \frac{\alpha \delta}{\alpha_1} \right) \frac{x}{\gamma_F} \right)$$

as required.

### Lemma 8.7

*If  $K/F$  is a tamely ramified quadratic extension and  $m \geq 2$  we may take  $P_{K/F}^*(\beta) = \beta$ .*

Notice that  $t + 1 = 1$  so that  $m \geq t + 1$ . In this case  $m' = 2m - 1$ ,  $d' = m - 1$ , and  $d' + \varepsilon' = m$ . If  $x \in \mathfrak{P}_K^{d'+\varepsilon'}$

$$N_{K/F}(1 + x) = 1 + S_{K/F}(x) + N_{K/F}(x)$$

is congruent to

$$1 + S_{K/F}(x)$$

modulo  $\mathfrak{P}_F^m$ . The lemma follows.

To complete the proof of Lemma 8.2 we have to show that if  $K/F$  is cyclic of prime order

$$N_{K/F}(P_{K/F}^*(\beta)) \equiv \prod_{\mu_F \in S(K/F)} (\beta + \alpha(\mu_F)) \pmod{\mathfrak{P}_F^d}.$$

We consider the cases discussed in the previous lemmas one by one. If the extension is unramified we may take all the numbers  $\alpha(\mu_F)$  to be 0. The congruences then reduce to the identity  $\beta^n = \beta^n$ . The same is true if  $K/F$  is cyclic of odd order and  $d \geq t + 1$  or  $K/F$  is quadratic and  $t = 0$ . If  $K/F$  is cyclic of odd order  $\ell$  and  $t + 1 \leq m \leq 2t + 1$  the right side becomes

$$\beta^\ell - \beta \alpha^{\ell-1}.$$

If  $\beta \equiv 0 \pmod{\mathfrak{P}_F^d}$  both sides are congruent to 0 modulo  $\mathfrak{P}_F^d$ . Suppose  $\beta$  does not belong to  $\mathfrak{P}_F^d$  and  $\beta O_F = \mathfrak{P}_F^u$ . Then  $\beta_1 O_K = \mathfrak{P}_K^u$  and

$$N_{K/F} \left( \beta - \beta_1 \frac{\alpha}{\alpha_2} \right)$$

is congruent to

$$\beta^\ell - \beta \alpha^{\ell-1} + \sum_{i=1}^{\ell-1} (-1)^i \beta^\ell E^i \left( \frac{\beta_1 \alpha}{\beta \alpha_1} \right)$$

modulo  $\mathfrak{P}_F^d$ . If  $x \in K$  then  $E^i(x)$  is the  $i$ th elementary symmetric function of  $x$  and its conjugates. Moreover  $\beta_1 \alpha / \beta \alpha_1$  belongs to  $\mathfrak{P}_K^{(\ell-1)(v-u)}$ . If  $\ell - 1 \geq i \geq 1$

$$\frac{i(\ell-1)(v-u) + (\ell-1)(t+1)}{\ell} \geq \frac{(\ell-1)(v+t+1)}{\ell} - \ell u.$$

The right side is

$$\frac{(\ell-1)}{\ell} m - pu \geq d - \ell u.$$

The argument of paragraph V.3 of Serre's book shows that

$$N_{K/F} \left( \beta - \beta_1 \frac{\alpha}{\alpha_1} \right) \equiv \beta^\ell - \beta \alpha^{\ell-1} \pmod{\mathfrak{P}_F^d}.$$

For a wildly ramified quadratic extension we use the notation of Lemma 8.6. The right side of the congruence may be taken to be  $\beta^2 + \beta \alpha \delta$ . The identity is again non-trivial only if  $\beta O_F = \mathfrak{P}_F^u$  with  $u < d$ . Then the left side may be taken to be

$$\beta^2 - \beta^2 \delta S_{K/F} \left( \frac{\beta_1 \alpha}{\beta \alpha_1} \right) + \delta^2 \alpha N_{K/F} \beta_1$$

which is congruent to

$$\beta^2 + \alpha \beta \delta - \beta^2 \delta S_{K/F} \left( \frac{\beta_1 \alpha}{\beta \alpha_1} \right)$$

modulo  $\mathcal{P}_F^d$ . Since

$$\frac{v-u+t+1}{2} \geq \frac{m}{2} - u \geq d-u$$

we have

$$\beta^2 S_{K/F} \left( \frac{\beta_1 \alpha}{\beta \alpha_1} \right) \equiv 0 \pmod{\mathfrak{P}_F^d}.$$

Suppose  $\chi_F$  is a quasi-character of  $C_F$ ,  $m = m(\chi_F)$ , and  $\beta = \beta(\chi_F)$ . If, as sometimes happens,  $m' = m(\chi_{K/F})$  we can take  $\beta(\chi_{K/F}) = P_{K/F}^*(\beta)$ .

**Lemma 8.8**

Suppose  $K/F$  is Galois and  $G = \mathfrak{G}(K/F)$ . Suppose  $s \geq 0$  is an integer and  $G^s = \{1\}$ . If  $m = m(\chi_F)$  and  $m > s$  then

$$m' = \psi_{K/F}(m - 1) + 1 = m(\psi_{K/F}).$$

It follows from paragraph V.6 of Serre's book that

$$N_{K/F}(U_K^{\psi_{K/F}(v)}) = U_F^v$$

if  $v \geq s$ . Thus  $\chi_{K/F}$  is trivial on  $U_K^u$  if  $u > \psi_{K/F}(m - 1)$  but is not trivial on  $U_K^i$  if  $u = \psi_{K/F}(m - 1)$ .

We can now collect together, with one or two additional comments, the previous results in a form which will be useful in the proof of the first main lemma. We use the same notation.

**Lemma 8.9**

Suppose  $K/F$  is a cyclic extension of prime order  $\ell$ ,  $\chi_F$  is a quasi-character of  $C_F$ ,  $m(\chi_F) \geq t + 1$ ,  $m(\chi_F) > 1$ , and  $m(\chi_{K/F}) - 1 = \psi_{K/F}(m(\chi_F) - 1)$ .

- (a) If  $K/F$  is unramified we may take  $\beta(\chi_{K/F}) = \beta(\chi_F)$  and  $\beta(\mu_F \chi_F) = \beta(\chi_F)$  for all  $\mu_F$  in  $S(K/F)$ .
- (b) If  $\ell$  is odd and  $d \geq t + 1$  we may take  $\beta(\chi_{K/F}) = \beta(\chi_F)$  and  $\beta(\mu_F \chi_F) = \beta(\chi_F)$  for all  $\mu_F$  in  $S(K/F)$ .
- (c) If  $\ell$  is odd and  $t + 1 \leq m \leq 2t + 1$  and  $\mu_F$  is a given non-trivial character in  $S(K/F)$  we may choose  $\alpha = \alpha(\mu_F) = N_{K/F}\alpha_1$  as in Lemma 8.5 and  $\beta = \beta(\chi_F) = N_{K/F}\beta_1$  for some  $\beta_1$  in  $U_K$ . Then we may choose

$$\beta(\chi_{K/F}) = \beta - \beta_1 \frac{\alpha}{\alpha_1}$$

and

$$\beta(\mu_F^\zeta \chi_F) = N_{K/F}(\beta_1 + \zeta \alpha_1).$$

(d) If  $\ell$  is 2 and  $K/F$  is wildly ramified we choose  $\alpha = \alpha(\mu_F)$  as in Lemma 8.6. We may choose  $\beta = \beta(\chi_F)$  in the form  $\delta N_{K/F} \beta_1$  with  $\delta$  in  $U_F^t$ . Then we may choose

$$\beta(\chi_{K/F}) = \beta - \beta_1 \frac{\alpha \delta}{\alpha_1}$$

and

$$\beta(\mu_F \chi_F) = \beta + \alpha \delta.$$

(e) If  $\ell$  is 2 and  $K/F$  is tamely ramified we may take  $\beta(\chi_{K/F}) = \beta(\mu_F \chi_F) = \beta(\chi_F)$ .

Only part (c) requires any further verification. It must be shown that

$$N_{K/F}(\beta_1 + \zeta \alpha_1) \equiv \beta + \zeta \alpha \pmod{\mathfrak{P}_F^d}.$$

The left side is congruent to

$$\beta N_{K/F} \left( 1 + \frac{\zeta \alpha_1}{\beta_1} \right).$$

All we need do is show that

$$N_{K/F} \left( 1 + \frac{\zeta \alpha_1}{\beta_1} \right) \equiv 1 + \frac{\zeta \alpha}{\beta} \pmod{\mathfrak{P}_F^d}.$$

The right side is

$$1 + N_{K/F} \left( \frac{\zeta \alpha_1}{\beta_1} \right).$$

According to paragraph V.3 of Serre's book the congruence will be satisfied if

$$\frac{v + (\ell - 1)(t + 1)}{\ell} \geq d.$$

But  $t + 1 = d + x$  with  $x \geq 0$  so that  $d + x + v = 2d + \varepsilon$  and  $v = d + \varepsilon - x$ . Thus

$$\frac{v + (\ell - 1)(t + 1)}{\ell} = \frac{d + \varepsilon - x + (\ell - 1)(d + x)}{\ell} = d + \frac{\varepsilon + (\ell - 2)x}{\ell} \geq d.$$

The preceding discussion has now to be repeated with different hypotheses and different, but similar, conclusions.

**Lemma 8.10**

Suppose  $K/F$  is abelian and  $G = \mathfrak{G}(K/F)$ . Suppose there is a  $t \geq 0$  such that  $G = G_t$  while  $G_{t+1} = \{1\}$ . If  $2 \leq m \leq t+1$  then  $m' = \psi_{K/F}(m-1) + 1$  is just  $m$ . Let  $t+1 = m+v$ , let  $\delta$  be such that  $\delta O_F = \mathfrak{P}_F^{t+1+n(\psi_F)}$ , let  $\varepsilon_1$  in  $O_K$  be such that  $\varepsilon_1 O_K = \mathfrak{P}_K^v$ , and let  $\varepsilon = N_{K/F}\varepsilon_1$ . We may choose  $\gamma_F = \delta/\varepsilon$  and  $\gamma_K = \delta/\varepsilon_1$ . Let  $r$  be the greatest integer in  $\frac{t+1}{2}$  and let  $s = t+1-r$ . If  $\mu_F$  is a non-trivial character in  $S(K/F)$  then  $m(\mu_F) = t+1$ . Let

$$\mu_F(1+x) = \psi_F \left( \frac{\beta(\mu_F)x}{\delta} \right)$$

for  $x$  in  $\mathfrak{P}_F^s$ . Then

$$\beta \prod_{\mu_F \neq 1} (\beta\varepsilon + \beta(\mu_F)) \equiv N_{K/F}(P_{K/F}^*(\beta)) \pmod{\mathfrak{P}_F^d}.$$

The relation  $m' = \psi_{K/F}(m-1) + 1 = m$  is an immediate consequence of the definitions. Since the extension is totally ramified

$$n(\psi_{K/F}) = [K:F]n + ([K:F] - 1)(t+1)$$

if  $n = n(\psi_F)$ . Thus

$$m+n = (t+1+n) - v$$

and

$$m' + n(\psi_{K/F}) = [K:F](t+1+n) + (m-t-1) = [K:F](t+1+n) - v.$$

Consequently  $\gamma_F$  and  $\gamma_K$  can be chosen as asserted. The results of chapter V of Serre's book imply that  $m(\mu_F) = t+1$  if  $\mu_F$  is not trivial.

We saw when proving Lemma 8.2 that if  $x \equiv y \pmod{\mathfrak{P}_K^{d'}}$  then  $N_{K/F}x \equiv N_{K/F}y \pmod{\mathfrak{P}_F^d}$  and that if  $F \subseteq L \subseteq K$  both  $L/F$  and  $K/L$  satisfy the conditions of the lemma. For  $L/F$ ,  $\varepsilon_1$  is replaced by  $N_{K/L}\varepsilon_1$  and, for  $K/L$ ,  $\varepsilon$  is replaced by  $N_{K/L}\varepsilon_1$ . Take  $Q_{L/F}^*$  to be  $P_{L/F}^*$  in the special case that  $m = t+1$  and  $\varepsilon_1 = 1$ . Then

$$\psi_{L/F} \left( \frac{N_{K/L}(\varepsilon_1)x P_{L/F}^*(\beta)}{\delta} \right) = \psi_F \left( \frac{\varepsilon P_{L/F}(x)\beta}{\delta} \right)$$

by definition. The right side is equal to

$$\psi_{L/F} \left( \frac{x Q_{L/F}^*(\varepsilon\beta)}{\delta} \right).$$

Thus

$$Q_{L/F}^*(\varepsilon\beta) \equiv N_{K/L}(\varepsilon_1)P_{L/F}^*(\beta) \pmod{\mathfrak{P}_L^s}.$$

If  $\mu_F$  belongs to  $S(K/F)$  but not to  $S(L/F)$  then  $m(\mu_{L/F}) = m(\mu_F)$  and  $\beta(\mu_{L/F})$  may be taken to be  $Q_{L/F}^*(\beta(\mu_F))$ . Let  $S'$  be a set of representatives for the cosets of  $S(L/F)$  in  $S(K/F) - S(L/F)$  and suppose the lemma is true for  $K/L$  and  $L/F$ . Then

$$N_{K/F}(P_{K/F}^*(\beta)) = N_{L/F}(N_{K/L}(P_{K/L}^*(P_{L/F}^*(\beta))))$$

is congruent to

$$N_{L/F}(P_{L/F}^*(\beta)) \prod_{\mu_F \in S'} \{N_{K/L}(\varepsilon_1)P_{L/F}^*(\beta) + Q_{L/F}^*(\beta(\mu_F))\}$$

modulo  $\mathfrak{P}_F^d$ . This in turn is congruent to

$$N_{L/F}(P_{L/F}^*(\beta)) \prod_{\mu_F \in S'} N_{L/F}(Q_{L/F}^*(\varepsilon\beta + \beta(\mu_F))).$$

Applying the induction hypothesis to the first part and Lemma 8.2 to the second, we see that the whole expression is congruent to

$$\beta \left\{ \prod_{\substack{\nu_F \in S(L/F) \\ \nu_F \neq 1}} (\varepsilon\beta + \beta(\nu_F)) \right\} \left\{ \prod_{\substack{\mu_F \in S' \\ \nu_F \in S(L/F)}} (\varepsilon\beta + \beta(\mu_F) + \beta(\nu_F)) \right\}$$

modulo  $\mathfrak{P}_F^d$  as required.

Once again we devote a lemma to cyclic extensions of prime order.

### Lemma 8.11

Suppose  $K/F$  is cyclic of prime order  $\ell$  and  $2 \leq m \leq t+1$ . Choose a non-trivial character  $\mu_F$  in  $S(K/F)$ . There is an  $\alpha_1$  in  $U_K$  such that if  $\alpha = N_{K/F}\alpha_1$

$$\mu_F(1+x) = \psi_F \left( \frac{\alpha x}{\delta} \right)$$

for  $x$  in  $\mathcal{P}_F^s$ . If  $\beta$  belongs to  $O_F$  there is a  $\beta_1$  in  $O_K$  such that  $\beta \equiv N_{K/F}(\beta_1) \pmod{\mathfrak{P}_F^t}$ . Then

$$P_{K/F}^*(\beta) \equiv \beta \frac{\varepsilon}{\varepsilon_1} - \beta_1 \frac{\alpha}{\alpha_1} \pmod{\mathfrak{P}_K^{d'}}.$$

Since  $\beta(\mu_F)$  is determined only modulo  $\mathfrak{P}_F^s$  and  $s \leq t$  we can take  $\beta(\mu_F) = N_{K/F}\alpha_1$  for some  $\alpha_1$  in  $U_K$ . The existence of  $\beta_1$  also follows as before. Since  $t+1 \geq m$

$$\frac{2(d' + \varepsilon') + (\ell - 1)(t + 1)}{\ell} \geq \frac{m + (\ell - 1)(t + 1)}{\ell} \geq m$$

and

$$N_{K/F}(1 + x) \equiv 1 + S_{K/F}(x) + N_{K/F}(x) \pmod{\mathfrak{P}_F^m}$$

if  $x$  belongs to  $\mathfrak{P}_K^{d' + \varepsilon'}$ . Thus

$$\psi_F \left( \frac{\varepsilon P_{K/F}(x)\beta}{\delta} \right) = \psi_{K/F} \left( \frac{\varepsilon x \beta}{\delta} \right) \psi_F \left( \frac{N_{K/F}(\varepsilon_1 x)\beta}{\delta} \right).$$

But  $d' + \varepsilon' + t \geq t + 1$  so that

$$N_{K/F}(\varepsilon_1 x)\beta \equiv \alpha N_{K/F} \left( \frac{\varepsilon_1 \beta_1}{\alpha_1} \cdot x \right) \pmod{\mathfrak{P}_F^{t+1}}$$

Since  $t + 1 = m + v$ ,  $d' + \varepsilon' + v \geq s$  and if  $y = \frac{\varepsilon_1 \beta_1}{\alpha_1} \cdot x$  then  $y$  which lies in  $\mathfrak{P}_K^{d' + \varepsilon' + v}$  also lies in  $\mathfrak{P}_K^s$ . But

$$\frac{2s + (t + 1)(\ell - 1)}{\ell} \geq t + 1$$

so that

$$N_{K/F}(1 + y) \equiv 1 + S_{K/F}(y) + N_{K/F}(y) \pmod{\mathfrak{P}_F^{t+1}}.$$

Consequently

$$\psi_F \left( \frac{-\alpha N_{K/F}(y)}{\delta} \right) = \psi_F \left( \frac{\alpha S_{K/F}(y)}{\delta} \right).$$

In conclusion

$$\psi_F \left( \frac{\varepsilon P_{K/F}(x)\beta}{\delta} \right) = \psi_{K/F} \left( \frac{\varepsilon_1}{\delta} \left( \frac{\varepsilon}{\varepsilon_1} \cdot \beta - \frac{\alpha}{\alpha_1} \cdot \beta_1 \right) x \right)$$

as required.

To complete the proof of Lemma 8.10 we have to show that when  $K/F$  is cyclic of prime order,  $\ell$

$$\beta \prod_{\mu_F \neq 1} (\beta \varepsilon + \beta(\mu_F)) \equiv N_{K/F}(P_{K/F}^*(\beta)) \pmod{\mathfrak{P}_F^d}$$

Since  $2 \leq m \leq t + 1$  the extension is wildly ramified,  $\ell = p$ , and once the character  $\mu_F$  is chosen as in the previous lemma we can define  $\mu_F^\zeta$  as in Lemma 8.5. The left side is congruent to

$$\beta (\beta^{\ell-1} \varepsilon^{\ell-1} + (-1)^\ell \alpha^{\ell-1}).$$

If  $\beta \in \mathfrak{P}_F^d$  this is congruent to 0 and so is the right side. Suppose  $\beta O_F = \mathfrak{P}_F^u$  with  $u < d$ . The right side is congruent to

$$N_{K/F} \left( \beta \frac{\varepsilon}{\varepsilon_1} - \beta_1 \frac{\alpha}{\alpha_1} \right) \equiv \beta \alpha^{\ell-1} N_{K/F} \left( \frac{\beta}{\beta_1} \frac{\alpha_1}{\alpha} \frac{\varepsilon}{\varepsilon_1} - 1 \right).$$

Since

$$\frac{(\ell-1)(u+v) + (\ell-1)(t+1)}{\ell} \geq \frac{\ell-1}{\ell} \cdot (t+1) \geq \frac{t+1}{2} \geq d$$

this is congruent to

$$\beta \alpha^{\ell-1} \left\{ N_{K/F} \left( \frac{\beta}{\beta_1} \frac{\alpha_1}{\alpha} \frac{\varepsilon}{\varepsilon_1} \right) + (-1)^\ell \right\}. \quad (8.1)$$

Since

$$\beta N_{K/F} (\beta_1^{-1}) \equiv 1 \pmod{\mathfrak{P}_F^{t-u}}.$$

We see that

$$\beta^{\ell+1} N_{K/F} \beta_1^{-1} \equiv \beta^\ell \pmod{\mathfrak{P}_F^t}$$

and that the expression (8.1) is congruent to

$$\beta^\ell \varepsilon^{\ell-1} + (-1)^\ell \beta \alpha^{\ell-1}$$

modulo  $\mathfrak{P}_F^d$ .

### Lemma 8.12

Suppose  $K/F$  is abelian and  $G = \mathfrak{G}(K/F)$ . Suppose there is an integer  $t$  such that  $G = G_t$  while  $G_{t+1} = \{1\}$ . Let  $\chi_F$  be a quasi-character of  $C_F$  and suppose  $2 \leq m(\chi_F) \leq t+1$ . If  $m(\chi_F) < t+1$  then  $m(\chi_{K/F}) = m(\chi_F)$ . If  $m(\chi_F) = t+1$  then  $m(\mu_F \chi_F) < t+1$  for some  $\mu_F$  in  $S(K/F)$  if and only if  $m(\chi_{K/F}) < m(\chi_F)$ .

It follows immediately from Lemma 6.7 that if  $\chi_F$  is any quasi-character of  $C_F$  and  $E$  any finite separable extension of  $F$  then

$$m(\chi_{E/F}) - 1 \leq \psi_{E/F}(m(\chi_F) - 1).$$

In the particular case under consideration Lemma 6.10 shows that if  $m = m(\chi_F) \leq t$  then

$$N_{K/F} : U_K^{m-1}/U_K^t \longrightarrow U_F^{m-1}/U_F^t$$

is an isomorphism. Thus  $\chi_{K/F}(\alpha)$  will be different from 1 for some  $\alpha$  in  $U_K^{m-1}$  and  $m(\chi_{K/F})$  will be at least  $m$ . If  $m(\chi_F) = t + 1$  then  $m(\mu_F \chi_F)$  is less than  $t + 1$  for some  $\mu_F$  in  $S(K/F)$  if and only if  $\chi_F$  is trivial on the image of  $U_K^t/U_K^{t+1}$  in  $U_F^t/U_F^{t+1}$ . This is so if and only if  $m(\chi_{K/F}) \leq t$ .

We shall need the following lemma in the proof of the first main lemma.

**Lemma 8.13**

*Suppose  $K/F$  is cyclic of prime order,  $\chi_F$  is a quasi-character of  $C_F$  with  $m(\chi_F) \leq t + 1$ , and  $m(\chi_{K/F}) = m(\chi_F)$ . Choose  $\alpha, \alpha_1, \varepsilon, \varepsilon_1$  in Lemma 8.11. We may choose  $\beta = \beta(\chi_F) = N_{K/F}\beta_1$  with  $\beta_1$  in  $U_K$  and we may choose*

$$\beta(\chi_{K/F}) = \beta \frac{\varepsilon}{\varepsilon_1} - \beta_1 \frac{\alpha}{\alpha_1}.$$

Moreover  $m(\mu_F^\zeta \chi_F) = t + 1$  and we may take

$$\beta(\mu_F^\zeta \chi_F) = N_{K/F}(\zeta \alpha_1 + \varepsilon_1 \beta_1).$$

Since  $\beta(\chi_F)$  is determined only modulo  $\mathfrak{P}_F^d$  and  $d \leq t$  the existence of  $\beta_1$  is clear. It is also clear that  $m(\mu_F^\zeta \chi_F) = t + 1$ . The elements  $\beta(\chi_F)$ ,  $\beta(\chi_{K/F})$ , and  $\beta(\mu_F^\zeta \chi_F)$  are to satisfy the following conditions:

(i) If  $x$  is in  $\mathfrak{P}_F^d$

$$\chi_F(1+x) = \psi_F \left( \frac{\varepsilon \beta(\chi_F)x}{\delta} \right).$$

(ii) If  $x$  is in  $\mathfrak{P}_K^{d'}$

$$\chi_{K/F}(1+x) = \psi_{K/F} \left( \frac{\varepsilon_1 \beta(\chi_{K/F})x}{\delta} \right).$$

(iii) If  $x$  is in  $\mathfrak{P}_F^s$

$$\mu_F^\zeta(1+x)\chi_F(1+x) = \psi_F \left( \frac{\beta(\mu_F^\zeta \chi_F)x}{\delta} \right).$$

We have already shown that  $\beta(\chi_{K/F})$  may be taken to be

$$\beta \frac{\varepsilon}{\varepsilon_1} - \beta_1 \frac{\alpha}{\alpha_1}$$

$\beta(\mu_F^\zeta \chi_F)$  must be congruent to  $\zeta\alpha + \varepsilon\beta$  modulo  $\mathfrak{P}_F^r$

$$N_{K/F}(\zeta\alpha_1 + \varepsilon_1\beta_1) = \zeta\alpha N_{K/F} \left( 1 + \frac{\varepsilon_1\beta_1}{\zeta\alpha_1} \right).$$

Since

$$\frac{\nu + (\ell - 1)(t + 1)}{\ell} \geq \frac{\ell - 1}{\ell}(t + 1) \geq r.$$

The right side is congruent to

$$\zeta\alpha \left\{ 1 + N_{K/F} \left( \frac{\varepsilon_1\beta_1}{\zeta\alpha_1} \right) \right\} = \zeta\alpha + \varepsilon\beta$$

modulo  $\mathfrak{P}_F^{r,*}$

\*(1998) The manuscript of Chapter 8 ends here.

## Chapter Nine.

### A Lemma of Hasse

Let  $\lambda \subseteq \kappa$  be two finite fields and let  $G = \mathfrak{G}(\kappa/\lambda)$ . If  $x \in \kappa$  set

$$\omega_{\kappa/\lambda}(x) = \sum x^{\sigma_1} x^{\sigma_2}$$

where the sum is taken over all unordered pairs of distinct elements of  $G$ . It is clear that

$$\omega_{\kappa/\lambda}(x+y) = \omega_{\kappa/\lambda}(x) + \omega_{\kappa/\lambda}(y) + S_{\kappa/\lambda}(x)S_{\kappa/\lambda}(y) - S_{\kappa/\lambda}(xy).$$

One readily verifies also that if  $\lambda \leq \eta \leq \kappa$  then

$$\omega_{\kappa/\lambda}(x) = \omega_{\eta/\lambda}(S_{\kappa/\eta}(x)) + S_{\eta/\lambda}(\omega_{\kappa/\eta}(x)).$$

Suppose  $\psi_\lambda$  is a non-trivial character of  $\lambda$  and  $\varphi_\lambda$  is a nowhere vanishing function on  $\lambda$  satisfying the identity

$$\varphi_\lambda(x+y) = \varphi_\lambda(x)\varphi_\lambda(y)\psi_\lambda(xy).$$

Define  $\varphi_{\kappa/\lambda}$  on  $\kappa$  by

$$\varphi_{\kappa/\lambda}(x) = \varphi_\lambda(S_{\kappa/\lambda}(x))\psi_\lambda(-\omega_{\kappa/\lambda}(x)).$$

Then  $\varphi_{\kappa/\lambda}(x+y)$  is equal to

$$\varphi_\lambda(S_{\kappa/\lambda}(x+y))\psi_\lambda(-\omega_{\kappa/\lambda}(x) - \omega_{\kappa/\lambda}(y) - S_{\kappa/\lambda}(x)S_{\kappa/\lambda}(y) + S_{\kappa/\lambda}(xy))$$

which is

$$\varphi_{\kappa/\lambda}(x)\varphi_{\kappa/\lambda}(y)\psi_{\kappa/\lambda}(xy).$$

If the fields have odd characteristic the following lemma is, basically, a special case of Lemma 7.7. That lemma has been proven in a simple and direct manner by Weil [14]. We shall use his method to prove the following lemma which in characteristic two, when it cannot be reduced to the previous lemma, is due to Hasse [8].

### Lemma 9.1

Let

$$\sigma(\varphi_\lambda) = - \sum_{x \in \lambda} \varphi_\lambda(x)$$

and let

$$\sigma(\varphi_{\kappa/\lambda}) = - \sum_{x \in \kappa} \varphi_{\kappa/\lambda}(x).$$

Then

$$\sigma(\varphi_{\kappa/\lambda}) = \sigma(\varphi_\lambda)^{[\kappa:\lambda]}.$$

If

$$P(X) = X^m - aX^{m-1} + bX^{m-2} - + \dots$$

is any monic polynomial with coefficients in  $\lambda$  set  $m(P) = m$  and

$$\chi_\lambda(P) = \varphi_\lambda(a) \psi_\lambda(-b).$$

If the degree of the polynomial is 1,  $b$  is taken to be 0; if the degree is 0 both  $a$  and  $b$  are taken to be 0. If

$$P'(X) = X^{m'} - a' X^{m'-1} + b' X^{m'-2} - + \dots$$

then

$$PP'(X) = X^{m+m'} - (a + a') X^{m+m'-1} + (b + b' + aa') X^{m+m'-2} - + \dots$$

and

$$\chi_\lambda(PP') = \varphi_\lambda(a + a') \psi_\lambda(-b - b' - aa') = \chi_\lambda(P) \chi_\lambda(P').$$

If  $t$  is an indeterminate we introduce the formal series

$$F_\lambda(t) = \sum \chi_\lambda(P) t^{m(P)} = \prod (1 - \chi_\lambda(P) t^{m(P)})^{-1}.$$

The sum is overall monic polynomials with coefficients in  $\lambda$  and the product is overall irreducible polynomials of positive degree with coefficients in  $\lambda$ . If  $r \geq 2$

$$\sum_{m(P)=r} \chi_\lambda(P) = 0$$

so that

$$F_\lambda(t) = 1 - \sigma(\varphi_\lambda)t.$$

If we replace  $\lambda$  by  $\kappa$ ,  $\varphi_\lambda$  by  $\varphi_{\kappa/\lambda}$ , and  $\psi_\lambda$  by  $\psi_{\kappa/\lambda}$ , we can define  $F_{\kappa/\lambda}(t)$  in a similar way. If  $k = [\kappa : \lambda]$  and  $T$  is the set of  $k$ th roots of unity the problem is to show that

$$\prod_{\zeta \in T} F_\lambda(\zeta t) = F_{\kappa/\lambda}(t^k).$$

Suppose  $P$  is an irreducible monic polynomial with coefficients in  $\lambda$  and  $P'$  is one of its monic irreducible factors over  $\kappa$ . Let  $m = m(P)$  and let  $r$  be the greatest common divisor of  $m$  and  $k$ . The field obtained by adjoining the roots of  $P$  to  $\kappa$  has degree  $\frac{mk}{r}$  over  $\lambda$  and is the same as the field obtained by adjoining the roots of  $P'$  to  $\kappa$ . Thus  $m(P') = \frac{m}{r}$  and  $P$  splits into  $r$  irreducible factors over  $\kappa$ . We shall show that

$$\chi_{\kappa/\lambda}(P') = \{\chi_{\lambda}(P)\}^{\frac{k}{r}}.$$

Thus if  $P'_1, \dots, P'_r$  are the factors of  $P$  and  $\ell = \frac{k}{r}$

$$\prod_{i=1}^r \{1 - \chi_{\kappa/\lambda}(P'_i) t^{km(P'_i)}\} = \{1 - \chi_{\lambda}(P) t^{\ell m}\}^r$$

which equals

$$\prod_{\zeta \in T} \{1 - \chi_{\lambda}(P) \zeta^m t^m\}.$$

The necessary identity follows.

Let  $\nu$  be the field obtained by adjoining a root  $x$  of  $P'$  to  $\kappa$  and let  $\mu$  be the field obtained by adjoining  $x$  to  $\lambda$ . If

$$P(X) = X^m - aX^{m-1} + bX^{m-2} \dots$$

then

$$a = S_{\mu/\lambda}(x)$$

and

$$b = \omega_{\mu/\lambda}(x).$$

Thus

$$\chi_{\lambda}(P) = \varphi_{\lambda}(S_{\mu/\lambda}(x)) \psi_{\lambda}(-\omega_{\mu/\lambda}(x)) = \varphi_{\mu/\lambda}(x).$$

Since  $\varphi_{\nu/\lambda}(x)$  is equal to

$$\varphi_{\lambda}(S_{\kappa/\lambda}(S_{\nu/\kappa}(x))) \psi_{\lambda}(-\omega_{\kappa/\lambda}(S_{\nu/\kappa}(x)) + S_{\kappa/\lambda}(\omega_{\nu/\kappa}(x)))$$

which in turn equals

$$\varphi_{\kappa/\lambda}(S_{\nu/\kappa}(x)) \psi_{\kappa/\lambda}(-\omega_{\nu/\kappa}(x)).$$

We conclude that

$$\chi_{\kappa/\lambda}(P') = \varphi_{\nu/\lambda}(x).$$

Replacing  $\kappa$  by  $\mu$  we see that  $\varphi_{\nu/\lambda}(x)$  equals

$$\varphi_{\mu/\lambda}(S_{\nu/\mu}(x)) \psi_{\mu/\lambda}(-\omega_{\nu/\mu}(x)) = \varphi_{\mu/\lambda}(\ell x) \psi_{\mu/\lambda}\left(-\ell \frac{(\ell-1)}{2} x^2\right).$$

One easily shows by induction that for every integer  $\ell$

$$\{\varphi_{\mu/\lambda}(x)\}^\ell = \varphi_{\mu/\lambda}(\ell x) \Psi_{\mu/\lambda} \left( -\ell \frac{(\ell-1)}{2} x^2 \right). \quad (9.1)$$

The relation

$$\chi_{\kappa/\lambda}(P') = \{\chi_\lambda(P)\}^\ell$$

follows.

Taking  $\mu = \lambda$  in the identity (9.1) we see that

$$\{\varphi_\lambda(x)\}^\ell = \varphi_\lambda(\ell x) \psi_\lambda \left( -\ell \frac{(\ell-1)}{2} x^2 \right)$$

for every integer  $\ell$ . Moreover  $\{\varphi_\lambda(0)\}^2 = \varphi_\lambda(0)$  so that  $\varphi_\lambda(0) = 1$ . If the characteristic  $p$  of  $\lambda$  is odd take  $\ell = p$  to see that  $\{\varphi_\lambda(x)\}^p = 1$ . If the characteristic is 2, take  $\ell = 4$  to see that  $\{\varphi_\lambda(x)\}^4 = 1$ . Suppose  $\varphi'_\lambda$  is another function on  $\lambda$  which vanishes nowhere and satisfies

$$\varphi'_\lambda(x+y) = \varphi'_\lambda(x) \varphi'_\lambda(y) \psi_\lambda(xy).$$

Then  $\varphi'_\lambda \varphi_\lambda^{-1}$  is a character and for some  $\alpha$  in  $\lambda$

$$\varphi'_\lambda(x) \equiv \varphi_\lambda(x) \psi_\lambda(\alpha x).$$

Of course

$$\varphi_\lambda(x) \psi_\lambda(\alpha x) = \varphi_\lambda(x + \alpha) \varphi_\lambda^{-1}(\alpha).$$

Thus

$$\sigma(\varphi'_\lambda) = \varphi_\lambda^{-1}(\alpha) \sigma(\varphi_\lambda).$$

If  $a$  and  $b$  are two non-zero complex numbers and  $m$  is a positive integer we write  $a \sim_m b$  if, for some integer  $r \geq 0$ ,  $\left(\frac{a}{b}\right)^{m^r} = 1$ .

### Lemma 9.2

If  $\alpha \in \lambda^\times$ , the multiplicative group of  $\lambda$ , let  $\nu(\alpha)$  be 1 or -1 according as  $\alpha$  is or is not a square in  $\lambda$ . Suppose  $\psi'_\lambda(x) = \psi_\lambda(\alpha x)$ ,  $\varphi_\lambda$  and  $\varphi'_\lambda$  are nowhere vanishing, and

$$\varphi_\lambda(x+y) = \varphi_\lambda(x) \varphi_\lambda(y) \psi_\lambda(xy)$$

while

$$\varphi'_\lambda(x+y) = \varphi'_\lambda(x) \varphi'_\lambda(y) \psi'_\lambda(xy).$$

Then

$$\sigma(\varphi'_\lambda) \sim_p \nu(\alpha)\sigma(\varphi_\lambda).$$

Moreover

$$\sigma(\varphi_\lambda) \sim_{2p} |\sigma(\varphi_\lambda)|.$$

Suppose first that  $p$  is odd. By the remarks preceding the statement of the lemma it is enough to prove the assertions for one choice of  $\varphi_\lambda$  and  $\varphi'_\lambda$ . For example we could take  $\varphi_\lambda(x) = \Psi_\lambda \left( \frac{x^2}{2} \right)$  and if  $\alpha = \beta^2$  we could take  $\varphi'_\lambda(x) = \psi_\lambda \left( \frac{(\beta x)^2}{2} \right)$ . In this case it is clear that  $\sigma(\varphi_\lambda) = \sigma(\varphi'_\lambda)$ . However if  $\alpha$  is not a square, we take  $\varphi'_\lambda(x) = \psi_\lambda \left( \frac{\alpha x^2}{2} \right)$ . Then

$$\sigma(\varphi_\lambda) + \sigma(\varphi'_\lambda) = 2 \sum_{x \in \lambda} \psi_\lambda \left( \frac{x}{2} \right) = 0.$$

With this choice of  $\varphi_\lambda$ ,

$$\overline{\varphi_\lambda(x)} = \psi_\lambda \left( -\frac{x^2}{2} \right)$$

so that  $\overline{\sigma(\varphi_\lambda)} = \nu(-1) \sigma(\varphi_\lambda)$ . Moreover it is well known and easily verified that  $\sigma(\varphi_\lambda) \neq 0$ . Since

$$\{\sigma(\varphi_\lambda)\}^4 = \{\nu(-1)\}^2 |\sigma(\varphi_\lambda)|^4 = |\sigma(\varphi_\lambda)|^4$$

we have

$$\sigma(\varphi_\lambda) \sim_{2p} |\sigma(\varphi_\lambda)|.$$

The absolute value on the right is of course the ordinary absolute value.

Suppose  $p$  is 2. Again any choice of  $\varphi_\lambda$  and  $\varphi'_\lambda$  will do. In this case  $\alpha$  is necessarily a square. Let  $\alpha = \beta^2$ . We can take  $\varphi'_\lambda(x) = \varphi_\lambda(\beta x)$ . Then  $\sigma(\varphi'_\lambda) = \sigma(\varphi_\lambda)$ . It is enough to prove the second assertion for any  $\psi_\lambda$  and any  $\varphi_\lambda$ . Let  $\phi$  be the prime field and let  $\psi_\phi$  be the unique non-trivial additive character of  $\phi$ . Take  $\psi_\lambda = \psi_{\lambda/\phi}$ . Let  $\varphi_\phi(0) = 1$ ,  $\varphi_\phi(1) = i$ . One verifies by inspection that

$$\varphi_\phi(x + y) = \varphi_\phi(x)\varphi_\phi(y)\psi_\phi(xy).$$

Take  $\varphi_\lambda = \varphi_{\lambda/\phi}$ . Since

$$\sigma(\varphi_{\lambda/\phi}) = \{\sigma(\varphi_\phi)\}^{[\lambda:\phi]},$$

it is enough to verify that

$$\sigma(\varphi_\phi) \sim_2 |\sigma(\varphi_\phi)|.$$

Since  $\sigma(\varphi_\phi) = -1 + i$ , this is no problem.

If  $a$  is a non-zero complex number set

$$A[a] = \frac{a}{|a|}.$$

The following lemma explains our interest in the numbers  $\sigma(\varphi_\lambda)$ .

**Lemma 9.3**

Suppose  $L$  is a non-archimedean local field and  $\chi_L$  is a quasi-character of  $C_L$  with  $m = m(\chi_L) = 2d + 1$ , where  $d$  is a positive integer. Let  $\psi_L$  be a non-trivial additive character of  $L$  and let  $n = n(\psi_L)$ . Let  $\gamma$  be such that  $\gamma O_L = \mathcal{P}_L^{m+n}$  and let  $\beta$  be a unit such that

$$\chi_L(1+x) = \psi_L\left(\frac{\beta x}{\gamma}\right)$$

for  $x$  in  $\mathfrak{P}_L^{d+1}$ . Choose  $\delta$  so that  $\delta O_L = \mathfrak{P}_L^d$  and let  $\psi_\lambda$  be the character of  $\lambda = O_L/\mathfrak{P}_L$  defined by

$$\psi_\lambda(x) = \psi_L\left(\frac{\beta \delta^2 x}{\gamma}\right).$$

If  $\varphi_\lambda$  is defined by

$$\varphi_\lambda(x) = \psi_L\left(\frac{\beta \delta x}{\gamma}\right) \chi_L^{-1}(1 + \delta x)$$

then

$$\varphi_\lambda(x+y) = \varphi_\lambda(x) \varphi_\lambda(y) \psi_\lambda(xy)$$

and

$$\Delta_3(\chi_L, \psi_L, \gamma) = A[-\sigma(\varphi_\lambda)].$$

In the statement of this lemma we have not distinguished, in the notation, between an element of  $O_L$  and its image in  $\lambda$ . This is convenient and not too ambiguous. It will be done again. The only questionable part of the lemma is the relation

$$\varphi_\lambda(x+y) = \varphi_\lambda(x) \varphi_\lambda(y) \psi_\lambda(xy).$$

Since

$$(1 + \delta x)(1 + \delta y) \equiv (1 + \delta x + \delta y)(1 + \delta^2 xy) \pmod{\mathfrak{P}_L^m}$$

we have

$$\chi_L^{-1}(1 + \delta x) \chi_L^{-1}(1 + \delta y) = \chi_L^{-1}(1 + \delta x + \delta y) \psi_L\left(-\frac{\beta \delta^2 xy}{\gamma}\right).$$

The required relation follows immediately.

There are a few remarks which we shall need later. It is convenient to formulate them explicitly now. We retain the notation of the previous lemma.

**Lemma 9.4**

*If  $m(\mu_L) < m(\chi_L)$  then*

$$\Delta_3(\mu_L \chi_L, \Psi_L; \gamma) \sim_p \Delta_3(\chi_L, \Psi_L; \gamma)$$

*and if  $m(\mu_L) \leq d$  we may take  $\beta(\mu_L \chi_L) = \beta(\chi_L)$  and then*

$$\Delta_3(\mu_L \chi_L, \psi_L; \gamma) = \Delta_3(\chi_L, \psi_L; \gamma).$$

In both cases  $m(\mu_L \chi_L) = m(\chi_L)$ . Moreover if  $x \in \mathfrak{P}_L^{2d}$

$$\psi_L \left( \frac{\beta(\mu_L \chi_L)x}{\gamma} \right) = \mu_L(1+x) \chi_L(1+x) = \chi_L(1+x)$$

which in turn equals

$$\psi_L \left( \frac{\beta(\chi_L)x}{\gamma} \right).$$

Thus

$$\beta(\mu_L \chi_L) \equiv \beta(\chi_L) \pmod{\mathfrak{P}_L}$$

and if

$$\psi_\lambda(x) = \psi_L \left( \frac{\beta(\chi_L)\delta^2 x}{\gamma} \right)$$

while

$$\psi'_\lambda(x) = \psi_L \left( \frac{\beta(\mu_L \chi_L)\delta^2 x}{\gamma} \right)$$

then  $\psi_\lambda = \psi'_\lambda$ . The first assertion of the lemma now follows from the previous two lemmas. It is clear that we can take  $\beta(\mu_L \chi_L) = \beta(\chi_L)$  if  $m(\mu_L) \leq d$ . Let the common value of the two numbers be  $\beta$ . Then

$$\psi_L \left( \frac{\beta \delta x}{\gamma} \right) \mu_L^{-1}(1+\delta x) \chi_L^{-1}(1+\delta x)$$

is equal to

$$\psi_L \left( \frac{\beta \delta x}{\gamma} \right) \chi_L^{-1}(1+\delta x).$$

We see now that the second assertion is completely trivial.

There is a corollary of this lemma which it is convenient to observe.

**Lemma 9.5**

*Suppose  $m(\chi_L) = 2d + \varepsilon$  where  $d$  is a positive integer and  $\varepsilon$  is 0 or 1. If  $m(\mu_L) \leq d$  and  $\mu_L$  is of order  $r$  then*

$$\Delta(\mu_L \chi_L, \psi_L) \sim_r \Delta(\chi_L, \psi_L).$$

Choose  $\gamma$  in the usual way so that

$$\Delta(\chi_L, \psi_L) = \chi_L(\gamma) \Delta_1(\chi_L, \psi_L; \gamma)$$

and

$$\Delta(\mu_L \chi_L, \psi_L) = \chi_L(\gamma) \mu_L(\gamma) \Delta_1(\mu_L \chi_L, \psi_L; \gamma).$$

It is clear that

$$\mu_L(\gamma) \sim_r 1.$$

If we take

$$\beta(\mu_L \chi_L) = \beta(\chi_L)$$

then, clearly,

$$\Delta_2(\mu_L \chi_L, \psi_L; \gamma) \sim_r \Delta_2(\chi_L, \psi_L, \gamma).$$

To complete the proof of Lemma 9.5 we have only to appeal to Lemma 9.4.

**Lemma 9.6**

*Suppose  $K$  is an unramified extension of  $L$  and  $\chi_L$  is a quasi-character of  $C_L$  with*

$$m = m(\chi_L) = 2d + 1$$

*where  $d$  is a positive integer. Let  $\psi_L$  be a non-trivial additive character of  $F$  and let  $n = n(\psi_L)$ . Suppose*

$$\chi_L(1 + x) = \psi_L \left( \frac{\beta x}{\varpi_L^{m+n}} \right)$$

*for  $x$  in  $\mathfrak{P}_L^{d+1}$ . Take*

$$\beta(\chi_L) = \beta(\chi_{K/L}) = \beta.$$

*If*

$$\varphi_\lambda(x) = \psi_L \left( \frac{\beta \varpi_L^d x}{\varpi_L^{m+n}} \right) \chi_L^{-1}(1 + \varpi_L^d x)$$

and if

$$\varphi_\kappa(x) = \psi_{K/L} \left( \frac{\beta \varpi_L^d x}{\varpi_L^{m+n}} \right) \chi_{K/L}^{-1}(1 + \varpi_L^d x)$$

for  $x$  in  $\kappa = 0_K/\mathfrak{P}_K$  then  $\varphi_\kappa = \varphi_{\kappa/\lambda}$ . Moreover if  $[K : L] = \ell$  then

$$\Delta_3(\chi_{K/L}, \psi_{K/L}, \varpi_L^{m+n}) = (-1)^{\ell-1} \{\Delta_3(\chi_L, \psi_L, \varpi_L^{m+n})\}^\ell.$$

Once we prove that  $\varphi_\kappa = \varphi_{\kappa/\lambda}$  this lemma will follow from Lemmas 9.1 and 9.3. If  $x$  belongs to  $K$  let  $E^2(x)$  be the second elementary symmetric function of  $x$  and its conjugates over  $L$ . If  $x$  belongs to  $O_K$

$$N_{K/F}(1 + \varpi_L^d x) \equiv (1 + \varpi_L^d S_{K/L} x) (1 + \varpi_L^{2d} E^2(x)) \pmod{\mathfrak{P}_L^m}.$$

Since

$$E^2(x) \equiv \omega_{\kappa/\lambda}(x) \pmod{\mathfrak{P}_F}$$

we have

$$\varphi_\kappa(x) = \varphi_\lambda(S_{K/L} x) \psi_\lambda(-\omega_{\kappa/\lambda}(x)) = \varphi_{\kappa/\lambda}(x).$$

Now suppose  $K$  is a ramified abelian extension of  $L$  and  $[K : L] = \ell$  is an odd prime. Let  $G = \mathfrak{G}(K/L)$  and suppose  $G = G_t$  while  $G_{t+1} = \{1\}$ . Suppose

$$m = m(\chi_L) = 2d + 1$$

is greater than or equal to  $t + 1$  and

$$\chi_L(1 + x) = \psi_L \left( \frac{\beta x}{\varpi_L^{m+n}} \right)$$

for  $x$  in  $\mathcal{P}_L^{d+1}$ . Let

$$d' = \ell d - \left( \frac{\ell - 1}{2} \right) t$$

and if  $x$  belongs to  $O_K$  set

$$\varphi'_\lambda(x) = \psi_{K/L} \left( \frac{\beta \varpi_K^{d'} x}{\varpi_L^{m+n}} \right) \chi_L^{-1}(1 + S_{K/L}(\varpi_K^{d'} x) + E^2(\varpi_K^{d'} x)).$$

Suppose also that

$$\varpi_L = N_{K/L} \varpi_K.$$

The assumptions listed, we may now state the next lemma.

**Lemma 9.7**

If

$$\varepsilon = S_{K/L} \left( \frac{\varpi_K^{2d'}}{\varpi_L^{2d}} \right)$$

then  $\varepsilon$  is a unit. Moreover  $\varphi'_\lambda$  is a function on  $\lambda = O_L/\mathcal{P}_L + O_K/\mathcal{P}_K$  which satisfies

$$\varphi'_\lambda(x + y) = \varphi'_\lambda(x)\varphi'_\lambda(y)\psi_\lambda(\varepsilon xy)$$

if

$$\psi_\lambda(u) = \psi_L \left( \frac{\beta u}{\varpi_L^{1+n}} \right).$$

If

$$\varphi_\lambda(x) = \psi_L \left( \frac{\beta x}{\varpi_L^{d+1+n}} \right) \chi_L^{-1} (1 + \varpi_L^d x)$$

then

$$A[\sigma(\varphi_\lambda)]^\ell = A[\sigma(\varphi'_\lambda)].$$

Since

$$\frac{d' + (\ell - 1)(t + 1)}{\ell} \geq d$$

the number

$$S_{K/L}(\varpi_K^{d'} x)$$

lies in  $\mathfrak{P}_L^d$ . Moreover  $E^2(\varpi_K^{d'} x)$  is a sum of traces of elements in  $\mathfrak{P}_K^{2d'}$ . Since

$$\frac{2d' + (\ell - 1)(t + 1)}{\ell} = 2d + \frac{\ell - 1}{\ell} \geq 2d$$

it lies in  $\mathfrak{P}_L^{2d}$ . If  $x$  lies in  $\mathfrak{P}_K$  it lies in  $\mathfrak{P}_L^m$  and

$$S_{K/L}(\varpi_K^{d'} x)$$

lies in  $\mathfrak{P}_L^{d+1}$  because

$$\frac{d' + 1 + (\ell - 1)(t + 1)}{\ell} = d + 1 + \frac{t(\ell - 1)}{2\ell} \geq d + 1.$$

Thus if  $x$  belongs to  $\mathcal{P}_K$

$$\varphi'_\lambda(x) = \psi_L \left( \frac{\beta}{\varpi_L^{m+n}} S_{K/L}(\varpi_K^{d'} x) \right) \chi_L^{-1}(1 + S_{K/L}(\varpi_K^{d'} x)) = 1.$$

Since

$$E^2(\varpi_K^{d'}(x + y))$$

is equal to

$$E^2(\varpi_K^{d'} x) + E^2(\varpi_K^{d'} y) + S_{K/L}(\varpi_K^{d'} x) S_{K/L}(\varpi_K^{d'} y) - S_{K/L}(\varpi_K^{2d'} xy),$$

the expression

$$1 + S_{K/L}(\varpi_K^{d'}(x + y)) + E^2(\varpi_K^{d'}(x + y))$$

is congruent modulo  $\mathfrak{P}_L^m$  to the product of

$$1 + S_{K/L}(\varpi_K^{d'} x) + E^2(\varpi_K^{d'} x)$$

and

$$1 + S_{K/L}(\varpi_K^{d'} y) + E^2(\varpi_K^{d'} y)$$

and

$$1 - S_{K/L}(\varpi_K^{2d'} xy).$$

Thus

$$\varphi'_\lambda(x + y) = \varphi'_\lambda(x) \varphi'_\lambda(y) \psi_\lambda(\varepsilon xy).$$

Since

$$\frac{2d' + (\ell - 1)(t + 1)}{\ell} \geq 2d$$

the number  $\varepsilon$  is in  $O_L$ . We conclude in particular that if  $y$  belongs to  $\mathfrak{P}_K$  then

$$\varphi'_\lambda(x + y) = \varphi'_\lambda(x).$$

If  $t = 0$  let  $\sigma$  be a generator of  $G$  and let  $\varpi_K^{1-\sigma} = \nu$ . In this case  $2d' = 2d\ell$  and

$$\frac{\varpi_K^{2d'}}{\varpi_L^{2d}} = \left\{ \prod_{\tau \in G} \varpi_K^{1-\tau} \right\}^{2d} \equiv \nu^{d\ell(\ell-1)} \pmod{\mathfrak{P}_L}$$

and

$$\varepsilon \equiv \ell \nu^{d\ell(\ell-1)} \pmod{\mathfrak{P}_L}$$

is a unit. If  $t > 0$

$$\varpi_K^{2d'} \equiv \varpi_L^{2d-t} \varpi_K^t \pmod{\mathfrak{P}_K}$$

so that

$$\varepsilon \equiv S_{K/L} \left( \frac{\varpi_K^t}{\varpi_L^t} \right) \pmod{\mathfrak{P}_L}.$$

It is shown in paragraph V.3 of Serre's book that the right side of this congruence is a unit.

First take  $p$  odd and let

$$\varphi_\lambda(x) = \psi_\lambda \left( \frac{x^2}{2} + \alpha x \right) = \psi_\lambda \left( \frac{(x + \alpha)^2}{2} \right) \psi_\lambda \left( \frac{-\alpha^2}{2} \right).$$

Then

$$\sigma(\varphi_\lambda) = -\psi_\lambda \left( \frac{-\alpha^2}{2} \right) \sum \psi_\lambda \left( \frac{(x + \alpha)^2}{2} \right) = -\psi_\lambda \left( \frac{-\alpha^2}{2} \right) \sum \psi_\lambda \left( \frac{x^2}{2} \right).$$

Making use of the calculations in the proof of Lemma 9.2 we see that

$$A[\sigma(\varphi_\lambda)]^\ell = \nu_\lambda(-1)^{\frac{\ell-1}{2}} \psi_\lambda \left( \frac{-\ell\alpha^2}{2} \right) A \left[ -\sum_\lambda \psi_\lambda \left( \frac{x^2}{2} \right) \right]$$

of  $\nu_\lambda$  is the non-trivial quadratic character of  $\lambda^\times$ .

Since

$$1 + S_{K/L} \left( \varpi_K^{d'} x \right) + E^2(\varpi_K^{d'} x)$$

is congruent to

$$\{1 + S_{K/L}(\varpi_K^{d'} x)\} \{1 + E^2(\varpi_K^{d'} x)\}$$

modulo  $\mathfrak{P}_L^m$  the value of  $\varphi'_\lambda(x)$  is

$$\psi_\lambda \left( \frac{(S_{K/L}y)^2 + 2\alpha S_{K/L}y - 2E^2(y)}{2} \right)$$

if

$$y = \frac{\varpi_K^{d'}}{\varpi_L^d} x.$$

Thus

$$\varphi'_\lambda(x) = \psi_\lambda \left( \frac{(S_{K/L}(y + \alpha)^2) - \ell\alpha^2}{2} \right).$$

Replacing  $x$  by

$$x - \frac{\varpi_L^d}{\varpi_K^{d'}} \alpha$$

and summing we find that

$$\sigma(\varphi'_\lambda) = \psi_\lambda \left( \frac{-\ell\alpha^2}{2} \right) \left\{ - \sum_x \psi_\lambda \left( \frac{\varepsilon x^2}{2} \right) \right\}.$$

Collecting this information together we see that to prove the lemma when the residual characteristic  $p$  is odd we must show that

$$\nu_\lambda(-1)^{\frac{\ell-1}{2}} = \nu_\lambda(\varepsilon).$$

Since  $\nu^{d\ell(\ell-1)}$  is certainly a square we have to show that

$$\nu_\lambda(-1)^{\frac{\ell-1}{2}} = \nu_\lambda(\ell)$$

when  $t = 0$ . If the field  $\lambda$  is of even degree over the prime field both sides are 1. If not, an odd power of  $p$  is congruent to 1 modulo  $\ell$  and the relation follows from the law of quadratic reciprocity. If  $t > 0$  then

$$\varepsilon \equiv S_{K/L} \left( \frac{\varpi_K^t}{\varpi_L^t} \right) \pmod{\mathfrak{P}_L}$$

and we can appeal to paragraph V.3 for a proof that

$$\varepsilon + u^{p-1} \equiv 0$$

has a solution in  $\lambda$ . Thus  $\nu_\lambda(\varepsilon) = \nu_\lambda(-1)$  and we have to show that

$$\nu_\lambda(-1)^{\frac{p-3}{2}} = 1.$$

If  $p \equiv 1 \pmod{4}$  then  $\nu_\lambda(-1) = 1$  and if  $p \equiv 3 \pmod{4}$  the exponent is even.

Before considering the case  $p = 2$ , we remark a simple consequence of the preceding discussion.

**Lemma 9.8**

If  $p$  is odd let

$$\varphi_\lambda(x) = \psi_\lambda \left( \frac{x^2}{2} + \alpha x \right).$$

If  $t = 0$  and

$$\mu = \nu^{d\ell \frac{(\ell-1)}{2}}$$

then

$$\varphi'_\lambda \left( \frac{x}{\mu} \right) = \psi_\lambda \left( \ell \left( \frac{x^2}{2} + \alpha x \right) \right)$$

and if  $t > 0$

$$\varphi'_\lambda(x) = \psi_\lambda \left( \frac{\varepsilon x^2}{x} \right).$$

In both cases

$$\varphi'_\lambda(x) = \psi_\lambda \left( \frac{(S_{K/L}(y + \alpha)^2) - \ell \alpha^2}{2} \right)$$

with

$$y = \frac{\varpi_K^{d'}}{\varpi_L^d} x.$$

If  $t = 0$  then  $y = \mu x$ . Thus if  $x$  belongs to  $O_L$ , as we may assume,

$$\varphi'_\lambda \left( \frac{x}{\mu} \right) = \psi_\lambda \left( \frac{\ell(x + \alpha)^2 - \ell \alpha^2}{2} \right) = \psi_\lambda \left( \ell \left( \frac{x^2}{2} + \alpha x \right) \right).$$

If  $t > 0$  then  $\ell = p$  is odd and

$$\frac{d'\ell d + (\ell - 1)(t + 1)}{\ell} = \frac{1}{\ell} \left\{ (\ell - 1)(t - 1) - \frac{(\ell - 1)}{2} t \right\} = \frac{1}{\ell} \left\{ (\ell - 1) + \frac{(\ell - 1)}{2} t \right\} \geq 1$$

so that, if  $x \in O_F$ ,

$$S_{K/L}(y + \alpha)^2 \equiv \varepsilon x^2 \pmod{\mathcal{P}_L}.$$

Now take  $p = 2$  so that  $t$  is necessarily 0 and again let

$$\mu = \nu^{d\ell \frac{(\ell-1)}{2}}$$

so that

$$\frac{\varpi_K^{d'}}{\varpi_L^d} \equiv \mu \pmod{\mathcal{P}_K}.$$

If  $x$  is in  $O_L$  and  $y = \frac{x}{\mu}$  then

$$\varphi'_\lambda \left( \frac{x}{\mu} \right) = \varphi'_\lambda(y)$$

is equal to

$$\psi_L \left( \frac{\ell x}{\varpi_L^{d+1+n}} \right) \chi_L^{-1} \left( 1 + \ell \varpi_L^d x + \frac{\ell(\ell-1)}{2} \varpi_L^{2d} x^2 \right).$$

Since

$$1 + \ell \varpi_L^d x + \frac{\ell(\ell-1)}{2} \varpi_L^{2d} x^2 \equiv (1 + \ell \varpi_L^d x) \left( 1 + \frac{\ell(\ell-1)}{2} \varpi_L^{2d} x^2 \right)$$

modulo  $\mathfrak{P}_L^m$  we have

$$\varphi'_\lambda \left( \frac{x}{\mu} \right) = \varphi_\lambda(\ell x) \psi_\lambda \left( \frac{-\ell(\ell-1)}{2} x^2 \right)$$

which equals

$$\{\varphi_\lambda(x)\}^\ell.$$

Moreover

$$\{\varphi_\lambda(x)\}^2 = \varphi_\lambda(2x) \psi_\lambda(-x^2) = \psi_\lambda(-x^2).$$

Since the characteristic is 2 there is an  $\alpha \neq 0$  such that

$$\psi_\lambda(x^2) = \psi_\lambda(\alpha x).$$

Then the complex conjugate of  $\varphi_\lambda(x)$  is

$$\varphi_\lambda(x) \psi_\lambda(\alpha x)$$

and

$$\sigma(\varphi_\lambda) = - \sum_x \varphi_\lambda(x + \alpha)$$

which equals

$$- \sum_x \varphi_\lambda(x) \varphi_\lambda(\alpha) \psi_\lambda(\alpha x)$$

is equal to

$$\varphi_\lambda(\alpha) \overline{\sigma(\varphi_\lambda)}.$$

Consequently

$$A[\sigma(\varphi_\lambda)]^\ell = \varphi_\lambda(\alpha)^{\frac{\ell-1}{2}} A[\sigma(\varphi_\lambda)].$$

Since

$$\{\varphi_\lambda(x)\}^4 = 1$$

we have

$$A[\sigma(\varphi'_\lambda)] = A[\sigma(\varphi_\lambda)]$$

if  $\ell \equiv 1 \pmod{4}$  and

$$A[\sigma(\varphi'_\lambda)] = A[\overline{\sigma(\varphi_\lambda)}] = \varphi_\lambda^{-1}(\alpha) A[\sigma(\varphi_\lambda)]$$

if  $\ell \equiv 3 \pmod{4}$ .

We have to show that

$$\varphi_\lambda(\alpha)^{\frac{\ell-1}{2}} = 1$$

if  $\ell \equiv 1 \pmod{4}$  and that

$$\varphi_\lambda(\alpha)^{\frac{\ell+1}{2}} = 1$$

if  $\ell \equiv 3 \pmod{4}$ . These relations are clear if  $\ell$  is congruent to 1 or 7 modulo 8. In general if  $\ell \equiv 1 \pmod{4}$

$$\varphi_\lambda(\alpha)^{\frac{\ell-1}{2}} = \psi_\lambda \left( -\frac{(\ell-1)(\ell-3)}{8} \alpha^2 \right)$$

and if  $\ell \equiv 3 \pmod{4}$

$$\varphi_\lambda(\alpha)^{\frac{\ell+1}{2}} = \psi_\lambda \left( -\frac{(\ell+1)(\ell-1)}{8} \alpha^2 \right).$$

Let  $\phi$  be the prime field and let  $\psi_\phi$  be its non-trivial additive character. Choose  $\alpha_1$  such that

$$\psi_{\lambda/\phi}(x) = \psi_\lambda(\alpha_1^2 x).$$

Then

$$\psi_\lambda(x^2) = \psi_{\lambda/\phi} \left( \frac{x^2}{\alpha_1^2} \right) = \psi_{\lambda/\phi} \left( \frac{x}{\alpha_1} \right) = \psi_\lambda(\alpha_1 x)$$

and  $\alpha = \alpha_1$ . Thus

$$\psi_\lambda(\alpha^2) = \psi_{\lambda/\phi}(1).$$

The right side is +1 or -1 according as  $f = [\lambda : \phi]$  is even or odd. But  $\ell$  divides  $2^f - 1$  so that, by the second supplement to the law of quadratic reciprocity,  $f$  is even if  $\ell$  is congruent to 3 or 5 modulo 8.

There is a complement to Lemma 9.7.

### Lemma 9.9

If  $m(\chi_L) \geq 2(t+1)$  choose  $\beta(\chi_{K/L}) = \beta(\chi_L) = \beta$  in  $O_L$ . If  $t+1 < m(\chi_L) < 2(t+1)$  choose  $\beta(\chi_L) = \beta$  and

$$\beta(\chi_{K/L}) = \beta - \beta_1 \frac{\alpha}{\alpha_1}$$

as in Lemma 8.9. Then  $m(\chi_{K/L}) = 2d' + 1$  and

$$\psi_{K/L} \left( \frac{\beta(\chi_{K/L}) \varpi_K^{d'} x}{\varpi_L^{m+n}} \right) \chi_{K/L}^{-1} (1 + \varpi_K^{d'} x)$$

is equal to

$$\psi_{K/L} \left( \frac{\beta \varpi_K^{d'} x}{\varpi_L^{m+n}} \right) \chi_L^{-1} (1 + S_{K/L}(\varpi_K^{d'} x) + E^2(\varpi_K^{d'} x)).$$

From Lemma 8.8 we have

$$m(\chi_{K/L}) = 1 + t + \ell(m - 1 - t) = 2 \left( \ell d - \frac{(\ell - 1)}{2} t \right) + 1$$

as required. If  $d \geq t + 1$  then

$$d' \geq \frac{(\ell + 1)}{2} d + \frac{(\ell - 1)}{2} (d - t) \geq m$$

because  $\ell$  is odd. Moreover,

$$\frac{3d' + (\ell - 1)(t + 1)}{\ell} \geq \frac{m' + (\ell - 1)(t + 1)}{\ell} = m.$$

Consequently

$$N_{K/L}(1 + \varpi_K^{d'} x) \equiv 1 + S_{K/L}(\varpi_K^{d'} x) + E^2(\varpi_K^{d'} x) \pmod{\mathfrak{P}_L^m}$$

and the lemma is valid if  $m \geq 2(t+1)$ .

If  $t+1 < m < 2(t+1)$  we still have

$$\frac{3d' + (\ell - 1)(t + 1)}{\ell} \geq m$$

so that

$$N_{K/L}(1 + \varpi_K^{d'} x)$$

is congruent to

$$1 + S_{K/L}(\varpi_K^{d'}x) + E^2(\varpi_K^{d'}x) + N_{K/L}(\varpi_K^{d'}x)$$

modulo  $\mathfrak{P}_L^m$ . Since  $d' \geq d + 1$  this is congruent to

$$\{1 + S_{K/L}(\varpi_K^{d'}x) + E^2(\varpi_K^{d'}x)\} \{1 + N_{K/L}(\varpi_K^{d'}x)\}$$

modulo  $\mathfrak{P}_L^m$ . Certainly

$$\chi_L(1 + N_{K/L}(\varpi_K^{d'}x)) = \psi_L \left( \frac{\beta N_{K/L}(\varpi_K^{d'}x)}{\varpi_L^{m+n}} \right).$$

Moreover, if  $m = t + 1 + v$

$$d' - v = d + \frac{\ell - 3}{2} \quad v \geq d \geq s$$

if  $s$  is the least integer greater than or equal to  $\frac{t}{2}$ . Thus, just as in the proof of Lemma 8.5,

$$\psi_L \left( \frac{\beta N_{K/L}(\varpi_K^{d'}x)}{\varpi_L^{m+n}} \right) = \psi_L \left( \frac{\alpha N_{K/L} \left( \frac{\beta_1}{\alpha_1} \varpi_K^{d'}x \right)}{\varpi_L^{m+n}} \right)$$

is equal to

$$\psi_L \left( \frac{-S_{K/L} \left( \frac{\alpha\beta_1}{\alpha_1} \varpi_K^{d'}x \right)}{\varpi_L^{m+n}} \right).$$

Multiplying the inverse of this with

$$\psi_{K/L} \left( \left( \beta - \frac{\alpha\beta_1}{\alpha_1} \right) \frac{\varpi_K^{d'}x}{\varpi_L^{m+n}} \right)$$

we obtain

$$\psi_{K/L} \left( \frac{\beta \varpi_K^{d'}x}{\varpi_L^{m+n}} \right).$$

The lemma follows.

If  $m = t + 1$  we may still choose

$$\beta(\chi_{K/L}) = \beta - \beta_1 \frac{\alpha}{\alpha_1}$$

as in Lemma 8.9. However the relation between  $\varphi_\lambda(x)$  and

$$\varphi_K(x) = \psi_{K/L} \left( \frac{\beta(\chi_{K/L}) \varpi_K^{d'} x}{\varpi_L^{m+n}} \right) \chi_{K/L}^{-1} (1 + \varpi_K^{d'} x)$$

will be more complicated. Here  $x = O_K/\mathfrak{P}_K$  is the same field as  $\lambda = O_L/\mathfrak{P}_L$ . We introduce it only for notational purposes.

Because  $m = t + 1$  the number  $t$  is at least 2 and

$$d = d' = \frac{t}{2}.$$

Since

$$\frac{3d + (p-1)(t+1)}{p} \geq t+1$$

and

$$\frac{d + (p-1)(t+1)}{p} \geq d+1$$

the expression

$$N_{K/L}(1 + \varpi_K^d x)$$

is congruent to

$$\{1 + S_{K/L}(\varpi_K^d x) + E^2(\varpi_K^d x)\} \{1 + \varpi_L^d N_{K/L} x\}$$

modulo  $\mathfrak{P}_L^m$  and

$$\chi_L(1 + S_{K/L}(\varpi_K^d x) + E^2(\varpi_K^d x))$$

is equal to

$$\Psi_L \left( \frac{\beta S_{K/L}(\varpi_K^d x) + \beta E^2(\varpi_K^d x)}{\varpi_F^{m+n}} \right).$$

According to Newton's formulae

$$S_{K/L}(\varpi_K^{2d} x^2) - S_{K/L}(\varpi_K^d x)^2 + 2E^2(\varpi_K^d x) = 0.$$

Thus

$$E^2(\varpi_K^d x) \equiv -\frac{1}{2} S_{K/L}(\varpi_K^{2d} x^2) \pmod{\mathcal{P}_L^m}.$$

Observe that  $p$  is equal to  $\ell$  and therefore, in the present circumstances, odd.

Let  $\mu_L$  be a character in  $S(K/L)$  as in Lemma 8.9(c) and let

$$\psi_L \left( \frac{\alpha x}{\varpi_L^{d+1+n}} \right) \mu_L^{-1}(1 + \varpi_L^d x) = \psi_\lambda \left( \rho \frac{x^2}{2} + \tau x \right)$$

with

$$\rho = \frac{\alpha}{\beta}.$$

Certainly

$$\mu_L(N_{K/L}(1 + \varpi_K^d x)) = 1$$

if  $x$  belongs to  $O_K$ . Replacing  $x$  by  $\frac{\beta_1}{\alpha_1} x$  we see that

$$\psi_L \left( \frac{1}{\varpi_L^{m+n}} \left\{ \alpha S_{K/L} \left( \frac{\beta_1}{\alpha_1} \varpi_K^d x \right) - \frac{\alpha}{2} S_{K/L} \left( \frac{\beta_1^2}{\alpha_1^2} \varpi_K^{2d} x^2 \right) + N_{K/L} (\beta_1 \varpi_K^d x) \right\} \right)$$

is equal to

$$\psi_\lambda \left( \rho \frac{z^2}{2} + \tau z \right)$$

if

$$z = \frac{1}{\varpi_L^d} \left\{ S_{K/L} \left( \frac{\beta_1}{\alpha_1} \varpi_K^d x \right) - \frac{1}{2} S_{K/L} \left( \frac{\beta_1^2}{\alpha_1^2} \varpi_K^{2d} x^2 \right) + N_{K/L} \left( \frac{\beta_1}{\alpha_1} \varpi_K^d x \right) \right\}$$

which is congruent to

$$\frac{\beta}{\alpha} N_{K/L} x \equiv \frac{\beta}{\alpha} x^p$$

modulo  $\mathfrak{P}_L$ .

Let

$$\varphi_\lambda(x) = \psi_L \left( \frac{\beta x}{\varpi_L^{d+1+n}} \right) \chi_L^{-1}(1 + \varpi_L^d x)$$

equal

$$\psi_\lambda \left( \frac{x^2}{2} + \sigma x \right).$$

If  $x$  belongs to  $O_K$

$$\chi_L^{-1}(1 + \varpi_L^d N_{K/L} x) = \psi_\lambda \left( \frac{x^{2p}}{2} + \sigma x^p \right) \psi_L \left( \frac{-\beta N_{K/L} x}{\varpi_L^{d+1+n}} \right).$$

We now put these facts together to find a suitable expression for  $\varphi_\kappa(x)$ . We may as well take  $x$  in  $O_L$ . Then  $\varphi_\kappa(x)$  is the product of

$$\psi_{K/L} \left( \frac{\beta \varpi_K^{d'} x}{\varpi_L^{m+n}} \right)$$

and

$$\psi_{K/L} \left( -\frac{\beta_1 \alpha}{\alpha_1} \frac{\varpi_K^d x}{\varpi_L^{m+n}} \right) \chi_L^{-1} (1 + \varpi_L^d N_{K/L} x)$$

and

$$\psi_L \left( -\frac{\beta}{\varpi_L^{m+n}} \left\{ S_{K/L}(\varpi_K^d x) - \frac{1}{2} S_{K/L}(\varpi_K^{2d} x^2) \right\} \right).$$

The second of these three expressions is equal to the product of

$$\psi_\lambda \left( \frac{x^{2p}}{2} + \sigma x^p \right) \psi_\lambda \left( -\rho^{-1} \frac{x^{2p}}{2} - \rho^{-1} \tau x^p \right)$$

and

$$\psi_{K/L} \left( -\frac{\alpha \beta_1^2 \varpi_K^{2d} x^2}{2 \alpha_1^2 \varpi_L^{m+n}} \right) = \psi_\lambda \left( -\frac{\varepsilon \rho \beta_1^2}{2 \alpha_1^2} x^2 \right)$$

if

$$\varepsilon = S_{K/L} \left( \frac{\varpi_K^{2d}}{\varpi_L^{2d}} \right).$$

The product of the first and third is equal to

$$\psi_\lambda \left( \frac{\varepsilon x^2}{2} \right).$$

As proven in paragraph V.3 of Serre's book the elements of  $U_L$  congruent to

$$1 + (\varepsilon x + x^p) \varpi_L^t$$

modulo  $\mathfrak{P}_L^{t+1}$  are all norms, so that

$$\psi_\lambda(\rho x^p) = \psi_\lambda(-\rho \varepsilon x).$$

In particular

$$\psi_\lambda \left( -\frac{\varepsilon \rho \beta_1^2}{2 \alpha_1^2} x^2 \right) = \psi_\lambda \left( \rho^{-1} \frac{x^{2p}}{2} \right).^*$$

\*(1998) The manuscript of Chapter 9 ends with this formula.

## Chapter Eleven.

### Artin–Schreier Equations

The theory of Artin–Schreier equations is central to Dwork’s proof of the second main lemma. We first review the basic theory, which we take from Mackenzie and Whaples [11], and then review Dwork’s rather amazing calculations. These we take from Lakkis [9].

We start with an exercise from Serre’s book [12]. Suppose  $F$  is a non-archimedean local field and  $K/F$  is Galois. Let  $p$  be the residual characteristic. With the convention  $(0) = \mathfrak{P}_F^\infty$  we let

$$p O_F = \mathfrak{P}_F^e.$$

Suppose  $G = \mathfrak{G}(K/F)$  and  $\sigma \in G_i$  with  $i \geq 1$ . Let

$$\varpi_K^\sigma = \varpi_K(1 + a)$$

with  $a$  in  $\mathfrak{P}_K^i$ . Let

$$\varphi(x) = x^\sigma - x.$$

$\varphi$  is an  $F$ -linear operator on  $K$ . If  $x = \alpha \varpi_K^j$  belongs to  $\mathfrak{P}_K^j$  then

$$\varphi(x) = x^\sigma - x = (\alpha^\sigma - \alpha) \varpi_K^{j\sigma} + \alpha(\varpi_K^{j\sigma} - \varpi_K^j)$$

is congruent to

$$\alpha \varpi_K^j \left( \varpi_K^{j(\sigma-1)} - 1 \right) = \alpha \varpi_K^j \{ (1 + a)^j - 1 \}$$

modulo  $\mathfrak{P}_K^{i+j+1}$ . This in turn is congruent to

$$(\alpha \varpi_K^j)(ja) = jax$$

modulo  $\mathfrak{P}_K^{i+j+1}$ .

If\*

$$\psi(x) = x^{\sigma^p} - 1$$

then, as an operator,

$$\psi = (1 + \varphi)^p - 1 = \sum_{k=1}^p \binom{p}{k} \varphi^k.$$

---

\* We seem to be dealing with yet another use of the symbol  $\psi$ !

If  $x$  belongs to  $\mathfrak{P}_K^j$  then

$$\varphi^k(x) \equiv j(j+i) \dots (j+(k-1)i)a^k x \pmod{\mathfrak{P}_K^{j+ki+1}}$$

and  $\psi(x)$  is congruent to

$$pjax + j(j+i) \dots (j+(p-1)i)a^p x$$

or to

$$pjax + j(j^{p-1} - i^{p-1})a^p x$$

modulo  $\mathfrak{P}_K^{i+j+e'+1}$  if  $p \nmid O_K = \mathfrak{P}_K^{e'}$ .

We deduce the following congruences:

(i) If  $(p-1)i > e'$  then

$$\psi(x) \equiv pjax \pmod{\mathfrak{P}_K^{i+j+e'+1}}.$$

(ii) If  $(p-1)i = e'$  then

$$\psi(x) \equiv pjax + j(1 - i^{p-1})a^p x \pmod{\mathfrak{P}_K^{i+j+e'+1}}.$$

(iii) If  $(p-1)i < e'$  then

$$\psi(x) \equiv j(1 - i^{p-1})a^p x \pmod{\mathfrak{P}_K^{i+j+1}}.$$

Observe that if  $(j, p) = 1$  and  $\sigma$  belongs to  $G_i$ , with  $i \geq 1$ , then

$$\varphi(x) \equiv 0 \pmod{\mathfrak{P}_K^{i+j+1}}$$

for all  $x$  in  $\mathfrak{P}_K^j$  if and only if  $\sigma$  belongs to  $G_{i+1}$ . It follows immediately that if  $\sigma$  belongs to  $G_1$  and  $i \geq 1$  then

$$\varphi(x) \equiv 0 \pmod{\mathfrak{P}_K^{i+j}}$$

for all  $x$  in  $\mathfrak{P}_K^j$  only if  $\sigma$  belongs to  $G_i$ .

If  $\sigma$  is replaced by  $\sigma P$  then  $\varphi$  is replaced by  $\psi$ . If  $k > \frac{e'}{p-1}$  and  $G_k \neq \{1\}$  then, for some  $i \geq k$ ,  $G_i \neq \{1\}$  and  $G_{i+1} = \{1\}$ . Taking  $(j, p) = 1$  we infer from (i) that if  $\sigma$  belongs to  $G_i$  but not to  $G_{i+1}$  then  $\sigma^p$  is in  $G_{i+e'}$  but not in  $G_{i+e'+1}$ . This is impossible. Thus  $G_k = \{1\}$  if

$k > \frac{e'}{p-1}$ . If  $G_1 \neq \{1\}$  then  $p$  divides  $e'$  so that if  $(p-1)i = e'$  the number  $i$  is also divisible by  $p$ . The congruence (ii) reduces to

$$\psi(x) \equiv j(pa + a^p) \pmod{\mathfrak{P}_K^{i+j+e'+1}}.$$

Thus if  $\sigma$  belongs to  $G_i$  its  $p$ th power  $\sigma^p$  lies in  $G_{i+e}$  and is therefore 1. Consequently

$$pa + a^p \equiv 0 \pmod{\mathfrak{P}_K^{pi+1}}.$$

Letting  $a = \alpha\varpi_K^i$  and  $p = \beta\varpi_K^e$  we find that

$$\alpha^p + \beta\alpha \equiv 0 \pmod{\mathfrak{P}_K}.$$

Since this congruence has only  $p$  roots the image of  $\Theta_i$  lies in a subset of  $U_K^i/U_K^{i+1}$  with  $p$  elements and  $G_i$  is either  $\{1\}$  or cyclic of order  $p$ .

If  $(p-1) < e'$  and  $(i, p) = 1$  the congruence (iii) implies that  $\sigma^p$  belongs to  $G_{pi+1}$  if  $\sigma$  belongs to  $G_i$ . However if  $(p-1)i < e'$  and  $p$  divides  $i$  it shows that  $\sigma^p$  belongs to  $G_{pi}$  but not to  $G_{pi+1}$  if  $\sigma$  belongs to  $G_i$  but not to  $G_{i+1}$ . Thus  $\sigma \rightarrow \sigma^p$  defines an injection of  $G_i/G_{i+1}$  into  $G_{pi}/G_{pi+1}$ . If  $G_i/G_{i+1}$  is not trivial neither is  $G_{pi}/G_{pi+1}$  and  $(p-1)pi \leq e'$ . If  $(p-1)pi < e'$  we can repeat the process. Thus, for some positive integer  $h$ ,  $(p-1)p^h i = e'$  and  $G_{p^h i}$  is not trivial. It is then cyclic of order  $p$ . According to Proposition IV.10 of Serre's book those  $k \geq 1$  for which  $G_k/G_{k+1} \neq \{1\}$  are all congruent modulo  $p$ . In particular if  $G_k/G_{k+1}$  is not trivial for some  $k \geq 1$  divisible by  $p$  it is not trivial only when  $k$  is divisible by  $p$ . The preceding discussion shows that if  $i$  is the smallest value of  $k \geq 1$  for which  $G_k/G_{k+1}$  is non-trivial then any  $\sigma$  in  $G_i$  but not in  $G_{i+1}$  generates  $G_i = G_1$ . In other words:

### Lemma 11.1

If  $G_1$  is not cyclic then  $(i, p) = 1$  if  $i \geq 1$  and  $G_i/G_{i+1} \neq \{1\}$ .

### Lemma 11.2

Suppose  $K/L$  is cyclic of prime degree and  $G = \mathfrak{G}(K/L)$  is equal to  $G_L$  with  $t \geq 1$  and  $(t, p) = 1$ . Then there is a  $\Delta$  in  $K$  and an  $a$  in  $L$  such that  $aO_L = \mathfrak{P}_L^{-t}$  and

$$\Delta^p - \Delta = a.$$

We observe first of all that  $[K : L]$  must be  $p$  and that if  $pO_K = \mathcal{P}_K^{e'}$  then  $(p-1)t < e'$ . If  $x$  belongs to  $K$  the symbol  $O(x)$  will stand for an element in  $xO_K$  and the symbol  $o(x)$  will stand for an element in  $x\mathfrak{P}_K$ . If

$$x = \sum_{i=0}^{p-1} a_i \varpi_K^i$$

with  $a_i$  in  $F$  then

$$|x| = \max_{0 \leq i < p} |a_i| |\varpi_K^i|.$$

Moreover if  $\sigma$  is a generator of  $G$

$$x^\sigma - 1 = \sum_{i=1}^{p-1} a_i \varpi_K^i (\varpi_K^{i(\sigma-1)} - 1)$$

and if  $\varpi_K^{\sigma-1} = (1 + a\varpi_K^t)$

$$|\varpi_K^{i(\sigma-1)} - 1| = |(1 + a\varpi_K^t)^i - 1| = |\varpi_K^t|$$

for  $1 \leq i < p$ . Thus

$$|x^\sigma - x| = |\varpi_K^t| \left\{ \max_{1 \leq i < p} |a_i| |\varpi_K^i| \right\} \leq |\varpi_K^t| |x|.$$

There is equality if  $a_0 = 0$ . In particular if

$$y = \sum_{i=1}^{p-1} a_i \varpi_K^i$$

then

$$x^\sigma - 1 = y^\sigma - 1$$

and

$$|y^\sigma - x| = |\varpi_K^t| |y|.$$

If  $x$  belongs to  $K$  let

$$\mathfrak{p}(x) = x^p - x.$$

Then

$$\mathfrak{p}(x+y) - \mathfrak{p}(x) - \mathfrak{p}(y) = \sum_{i=1}^{p-1} \binom{p}{i} x^i y^{p-i} \quad (11.1)$$

Since  $e' - (p-1)t > 0$  the right side is  $o(y)$  if

$$v_K(x) \geq -t$$

and

$$v_K(y) \geq -t.$$

We define  $v_K(x)$  by the equation

$$|x| = |\varpi_K|^{v_K(x)}.$$

To prove the lemma we construct a sequence  $\Lambda_0, \Lambda_1, \Lambda_2, \dots$  and a sequence  $\Theta_0, \Theta_1, \dots$  with the following properties:

(i)  $v_K(\Lambda_n) = -t$  for all  $n \geq 0$ .

(ii) If  $\sigma$  is a given generator of  $G$  and  $\zeta$  is a given  $(p-1)$ th root of unity

$$\Lambda_n^\sigma - \Lambda_n = \zeta + o(1).$$

(iii)

$$\mathfrak{p}(\Lambda_n^\sigma) - \mathfrak{p}(\Lambda_n) = \Theta_n^\sigma - \Theta_n$$

and

$$|\Theta_n^\sigma - \Theta_n| = |\varpi_K^t| |\Theta_n|.$$

(iv)

$$\Lambda_{n+1} = \Lambda_n + \Theta_n.$$

(v)

$$\mathfrak{p}(\Lambda_{n+1}^\sigma) - \mathfrak{p}(\Lambda_{n+1}) = o(\mathfrak{p}(\Lambda_n^\sigma) - \mathfrak{p}(\Lambda_n)).$$

It will follow from (iii) and (v) that  $\{\Theta_n\}$  is converging to 0. Then (iv) implies that  $\{\Lambda_n\}$  has a limit  $\Delta$ . (i) implies that  $v_K(\Delta) = -t$  and (v) implies that  $\Delta^p - \Delta = a$  belongs to  $F$ . From (ii)

$$\Delta^\sigma - \Delta = \zeta + o(1).$$

To construct  $\Lambda_0$  let  $\alpha$  belong to  $U_K^i$  and consider

$$\frac{\alpha^\sigma}{\varpi_K^{\sigma t}} - \frac{\alpha}{\varpi_K^t} = \frac{\alpha^\sigma - \alpha}{\varpi_K^{\sigma t}} + \frac{\alpha}{\varpi_K^t} \left( \varpi_K^{t(1-\sigma)} - 1 \right) = -ta\alpha + o(1)$$

if

$$\varpi_K^\sigma = \varpi_K(1 + a\varpi_K^t).$$

We can choose  $\alpha$  so that

$$-ta\alpha = \zeta + o(1).$$

Then we set

$$\Lambda_0 = \frac{\alpha}{\varpi_K^t}.$$

We observe in passing that conditions (i) and (ii) determine  $\Lambda_n$  modulo  $\mathfrak{P}_K^{-t+1}$ .

Suppose  $\Lambda_0, \dots, \Lambda_n$  have been defined. Then

$$\mathfrak{p}(\Lambda_n^\sigma) = \mathfrak{p}(\Lambda_n) + \mathfrak{p}(\zeta + o(1)) + o(1)$$

which equals

$$\mathfrak{p}(\Lambda_n) + \mathfrak{p}(\zeta) + o(1) = \mathfrak{p}(\Lambda_n) + o(1).$$

Choose  $\Theta_n$  so that

$$\Theta_n^\sigma - \Theta_n = \mathfrak{p}(\Lambda_n^\sigma) - \mathfrak{p}(\Lambda_n)$$

and

$$|\Theta_n^\sigma - \Theta_n| = |\varpi_K^t| |\Theta_n|.$$

Then  $v_K(\Theta_n) > -t$  and if

$$\Lambda_{n+1} = \Lambda_n + \Theta_n$$

$v_K(\Lambda_{n+1}) = -t$ . Moreover

$$\Lambda_{n+1}^\sigma - \Lambda_{n+1} = \Lambda_n^\sigma - \Lambda_n + o(1) = \zeta + o(1).$$

and

$$\mathfrak{p}(\Lambda_{n+1}) = \mathfrak{p}(\Lambda_n) + \mathfrak{p}(\Theta_n) + x$$

with  $x = o(\Theta_n)$ . Then

$$x^\sigma - x = o(\Theta_n^\sigma - \Theta_n) = o(\mathfrak{p}(\Lambda_n^\sigma) - \mathfrak{p}(\Lambda_n)).$$

Also

$$\mathfrak{p}(\Theta_n^\sigma) - \mathfrak{p}(\Theta_n) = \mathfrak{p}(\Theta_n^\sigma - \Theta_n) + o(\Theta_n^\sigma - \Theta_n).$$

Since  $v_K(\Theta_n^\sigma - \Theta_n)$  is positive the right side is

$$-(\Theta_n^\sigma - \Theta_n) + o(\Theta_n^\sigma - \Theta_n).$$

Thus

$$\mathfrak{p}(\Lambda_{n+1}^\sigma) - \mathfrak{p}(\Lambda_{n+1})$$

which equals

$$\mathfrak{p}(\Lambda_n^\sigma) - \mathfrak{p}(\Lambda_n) - (\Theta_n^\sigma - \Theta_n) + o(\mathfrak{p}(\Lambda_n^\sigma) - \mathfrak{p}(\Lambda_n))$$

is

$$o(\mathfrak{p}(\Lambda_n^\sigma) - \mathfrak{p}(\Lambda_n)).$$

**Lemma 11.3**

Supposer  $\Delta_1$  belongs to  $K$ ,  $a$  belongs to  $L$ ,  $v_L(a) = -t$  and

$$\Delta_1^p - \Delta_1 = a + O(\varpi_K^r)$$

with  $r \geq 1$ . Define  $\Delta_n$  inductively by

$$\Delta_{n+1} = \Delta_n^p - a.$$

Then

$$\Delta_{n+1} - \Delta_n = o(\Delta_n - \Delta_{n-1})$$

if  $n \geq 2$  and if  $r \geq (e' - (p-1)t)$

$$\Delta_{n+1} - \Delta_n = O(\varpi_K^{r+(n-1)(e'-(p-1)t)}).$$

Moreover

$$\lim_{n \rightarrow \infty} \Delta_n = \Delta$$

exists and  $\Delta^p - \Delta = a$ .

The last assertion is a consequence of the first. It is clear that

$$\Delta_2 - \Delta_1 = O(\varpi_K^r).$$

Suppose  $n \geq 2$ , and

$$\Delta_n - \Delta_{n-1} = x = o(1).$$

Then

$$\Delta_{n+1} - \Delta_n = \Delta_n^p - \Delta_{n-1}^p = (\Delta_{n-1} + x)^p - \Delta_{n-1}^p$$

is equal to

$$\left\{ \sum_{k=1}^{p-1} \binom{p}{k} \Delta_{n-1}^k x^{p-k} \right\} + x^p$$

which is  $o(x)$  because  $e' - (p-1)t > 0$ . If

$$x = O(\varpi_K^{r+(n-2)(e'-(p-1)t)})$$

and  $r \geq e' - (p-1)t$  it is

$$O(\varpi_K^{r+(n-1)(e'-(p-1)t)}).$$

The lemma has a couple of corollaries which should be remarked.

**Lemma 11.4**

If  $a$  is in  $L$ ,  $v_L(a) = -t$ ,  $\Delta^p - \Delta = a$ , and  $\xi$  is a  $(p-1)$ th root of unity there is a number  $\Delta_\xi$  such that

$$\Delta_\xi = \Delta + \xi + O(\varpi_K^{e'-(p-1)t})$$

and

$$\Delta_\xi^p - \Delta_\xi = a.$$

Relation (11.1) shows that  $\Delta + \xi$  satisfies the conditions of the previous lemma with  $r = e' - (p-1)t$ .

**Lemma 11.5**

Suppose  $\Delta$  belongs to  $K$ ,  $b$  belongs to  $L$ ,  $v_L(b) = -t$  and

$$\Delta^p - \Delta = b.$$

Then for any  $u$  in  $U_L^{t+1}$  the equation

$$\Lambda^p - \Lambda = bu$$

has a solution in  $K$ .

Take, in Lemma 11.3,  $a = bu$  and  $\Delta_1 = \Delta$ . Lemma 11.5 shows that if  $S$  is the set of all in  $L$  with  $v_L(a) = -t$  for which the equation

$$\Delta^p - \Delta = a$$

has a solution in  $K$  then  $S = SU_L^{t+1}$ .

**Lemma 11.6**

If  $\ell$  is the integral part of  $\frac{t}{p}$  the number of cosets of  $U_L^{t+1}$  in  $S$  is

$$\frac{p-1}{p} [O_L : \mathfrak{P}_L]^{1+\ell}.$$

Fix a generator  $\sigma$  of  $G = \mathfrak{G}(K/L)$ . If  $a$  belongs to  $S$ ,  $\Delta^p - \Delta = a$ , and  $\xi$  is a  $(p-1)$ th root of unity

$$(\xi\Delta)^p - \xi\Delta = \xi a.$$

By Lemma 11.4 there is a  $(p - 1)$ th root of unity  $\zeta$  such that

$$\Delta^\sigma = \Delta + \zeta + o(1).$$

Then

$$(\xi\Delta)^\sigma = \xi\Delta + \xi\zeta + o(1).$$

Thus if  $S'$  is the set of  $a$  in  $L$  with  $v_L(a) = -t$  for which

$$a = \Delta^p - \Delta$$

with

$$\Delta^\sigma = \Delta + 1 + o(1)$$

the number of cosets of  $U_L^{t+1}$  in  $S$  is  $p - 1$  times the number of cosets of  $U_L^{t+1}$  in  $S'$ .

Choose  $\Delta_0$ , with  $v_K(\Delta_0) = -t$ , for which  $\Delta_0^p - \Delta_0 = a_0$  is in  $F$  and

$$\Delta_0^\sigma = \Delta_0 + 1 + o(1).$$

If  $v_K(\Delta) = -t$ ,  $\Delta^p - \Delta$  is in  $F$ , and

$$\Delta^\sigma = \Delta + 1 + o(1)$$

then, according to an earlier remark,

$$\Delta = \Delta_0 + \Omega_0$$

with  $\Omega_0 = o(\Delta_0)$ .

Choose any  $\Omega_0 = o(\Delta_0)$  and set  $\Lambda_0 = \Delta_0 + \Omega_0$ . According to the relation (A)

$$\mathfrak{p}(\Lambda_0) = \mathfrak{p}(\Delta_0) + \mathfrak{p}(\Omega_0) + o(\Omega_0).$$

Since

$$\Omega_0^\sigma - \Omega_0 = O(\varpi_K^t \Omega_0) = o(1)$$

we have

$$\Omega_0^{\sigma^p} - \Omega_0^p = \sum_{i=1}^{p-1} \binom{p}{i} \Omega_0^{p-i} (\Omega_0^\sigma - \Omega_0)^i = o(\Omega_0^\sigma - \Omega_0).$$

Thus

$$\mathfrak{p}(\Lambda_0)^\sigma - \mathfrak{p}(\Lambda_0) = \Omega_0^\sigma - \Omega_0 + o(\varpi_K^t \Omega_0)$$

and  $\mathfrak{p}(\Lambda_0)$  is in  $L$  only if

$$\Omega_0^\sigma - \Omega_0 = o(\varpi_K^t \Omega_0),$$

that is, only if  $\Omega_0 = \alpha_0 + o(\Omega_0)$  with  $\alpha_0$  in  $L$ . On the other hand if

$$\Omega_0^\sigma - \Omega_0 = o(\varpi_K^t \Omega_0)$$

and we construct the sequence  $\Lambda_0, \Lambda_1, \Lambda_2, \dots$  as before and let

$$\Delta = \lim_{n \rightarrow \infty} \Lambda_n$$

then

$$\Delta = \Lambda_0 + o(\Omega_0).$$

We conclude that the number of cosets in  $\mathfrak{P}_K^s / \mathfrak{P}_K^{s+1}$ ,  $s > -t$ , containing an  $\Omega_0$  such that

$$(\Delta_0 + \Omega_0)^p - (\Delta_0 + \Omega_0)$$

is in  $L$  is 1 if  $p$  does not divide  $s$  and is  $[O_L : \mathfrak{P}_L]$  if it does.

Choose  $\Delta$  so that

$$\Delta^p - \Delta = a$$

is in  $S'$ . If  $\Omega$  belongs to  $\mathfrak{P}_K^s$ ,  $s > -t$ , but not to  $\mathfrak{P}_K^{s+1}$  and

$$(\Delta + \Omega)^p - \Delta - \Omega = b$$

is also in  $S'$  then  $a$  and  $b$  belong to the same coset of  $U_L^{t+1}$  if and only if

$$b = a + o(1).$$

If  $s > 0$

$$\mathfrak{p}(\Delta + \Omega) = \mathfrak{p}(\Delta) + o(1)$$

but if  $s \leq 0$

$$\mathfrak{p}(\Delta + \Omega) = \mathfrak{p}(\Delta) + \Omega^p - \Omega + o(\Omega)$$

and

$$\Omega^p - \Omega + o(\Omega) = o(1)$$

if and only if  $s = 0$  and

$$\Omega = \xi + o(1)$$

where  $\xi$  is some  $(p-1)$ th root of unity. The lemma follows.

If  $x = \{x_1, \dots, x_n\}$  let  $E^i(x)$  be the  $i$ th elementary symmetric function of  $x_1, \dots, x_n$  and let

$$S^i(x) = \sum_{k=1}^n x_k^i.$$

If  $Z$  is an indeterminate and

$$Q(Z) = \sum_{i=0}^n (-1)^i E^i(x) Z^i = \prod_{i=1}^n (1 - x_i Z)$$

then

$$\sum_{i=1}^{\infty} S^i(x) Z^i$$

is clearly  $-Z$  times the logarithmic derivative of  $Q(Z)$ . Thus

$$\left( \sum_{i=1}^{\infty} S^i(x) Z^i \right) \left( \sum_{i=0}^n (-1)^i E^i(x) Z^i \right) = - \sum_{i=0}^n (-1)^i i E^i(x) Z^i.$$

This identity which we refer to as Newton's identity is equivalent to the formulae of Newton. It implies in particular that

$$\sum_{j=0}^{i-1} (-1)^j S^{i-j}(x) E^j(x) = (-1)^{i+1} i E^i(x) \quad (11.2)$$

if  $1 \leq i \leq n$ . We may divide Newton's identity by  $Q(Z)$  and then expand the right-hand side to obtain expressions for the  $S^i(x)$  as polynomials in  $E^1(x), \dots, E^n(x)$ . The coefficients are necessarily integers. To calculate them we suppose that  $x_1, \dots, x_n$  lie in a field of characteristic zero. Let

$$Q(Z) = 1 + P(Z).$$

Then

$$\log Q(Z) = - \sum_{k=1}^{\infty} \frac{(-1)^k}{k} (P(Z))^k.$$

The coefficient of  $Z^{i-1}$  in the derivative of the right side is

$$- \sum_k \sum_{\substack{\alpha_1 + \dots + \alpha_n = k \\ \alpha_1 + 2\alpha_2 + \dots + n\alpha_n = i}} \frac{i(k-1)!}{\alpha_1! \dots \alpha_n!} \prod_{j=1}^n \{E^j(x)\}^{\alpha_j}.$$

This expression is therefore equal to  $-S^i(x)$ .

Suppose  $K/L$  is a ramified cyclic extension of degree  $p$  and  $G = \mathfrak{G}(K/L)$ . Let  $G = G_t$  and  $G_{t+1} = \{1\}$ . Suppose  $u \leq t$ ,  $\Lambda$  is in  $K$ , and

$$\Lambda O_K = \mathfrak{P}_K^{-u}.$$

We take  $\{x_1, \dots, x_n\}$  to be  $\Lambda$  and its conjugates under  $G$ . In this case we write

$$E^i(x) = E_{K/L}^i(\Lambda)$$

and

$$S^i(x) = S_{K/L}^i(\Lambda).$$

If  $1 \leq i \leq p-1$  and  $\gamma_i$  is any integer less than or equal to

$$\frac{-iu + (p-1)(t+1)}{p}$$

we have

$$E_{K/L}^i(\Lambda) \equiv 0 \pmod{\mathcal{P}_L^{\gamma_i}}.$$

We may take

$$\gamma_i \geq -\frac{iu}{p} + \frac{(p-1)t}{p}.$$

If  $iu + t$  is not divisible by  $p$  this inequality may be supposed strict.

Suppose  $\alpha_1, \dots, \alpha_p$  are non-negative integers,

$$\sum_{i=1}^p \alpha_i = k$$

and

$$\sum_{i=1}^p i\alpha_i = \ell.$$

If

$$\gamma = \left\{ \sum_{i=1}^{p-1} \gamma_i \alpha_i \right\} - u\alpha_p.$$

Then

$$\prod_{i=1}^p \{E^i(\Lambda)\}^{\alpha_i} \equiv O(\varpi_K^\gamma). \quad (11.3)$$

We have

$$\gamma \geq -\frac{\ell u}{p} + \frac{(p-1)}{p} k t - \frac{(p-1)}{p} \alpha_p t.$$

The inequality is strict if  $\alpha_i$  is non-zero for some  $i$  such that  $iu + t$  is not divisible by  $p$ .

We record now some inequalities that  $\gamma$  satisfies in various special cases. They will be needed later. We observe first of all that, if  $1 \leq i < p$ ,  $\gamma_i$  is non-negative and is positive unless  $p$  divides  $iu + t$ .

(i) If  $\ell = p$  and  $k = 2$  then

$$1 + u + \gamma \geq 1 + t.$$

In this case  $\alpha_p = 0$  and the left side is at least

$$1 + \frac{2(p-1)}{p}t \geq 1 + t.$$

If  $p$  is odd the inequality is strict.

(ii) If  $\ell = p$  and  $k = 2$  then

$$\gamma \geq 0.$$

Moreover the inequality is strict if  $p$  is odd. This statement is of course weaker than that of (i).

(iii) If  $\ell = p$ ,  $k \geq 3$ , and  $p$  is odd, then

$$\gamma \geq u + \frac{t-u}{p}$$

$\alpha_p$  is again 0. The left side is at least

$$-u + \frac{3(p-1)}{p}t = u + \frac{t-u}{p} + \frac{1}{p} \{(3p-4)t - (2p-1)u\}.$$

The final term is non-negative. The inequality is strict if  $u \neq t$ . If  $u = t$  and  $p$  does not divide  $u$  it is again strict for then  $\alpha_i \neq 0$  for some  $i < p-1$  and for such an  $i$  the number  $iu + t$  is not divisible by  $p$ .

(iv) If  $k \leq p$  then

$$(p-1)u + \gamma \geq u + \frac{t-u}{p}$$

except when  $\alpha_p = k$  or  $\alpha_p = p-1$ . We have to show that

$$(p-2)u + \gamma + \frac{u-t}{p} \geq 0.$$

The left side is at least

$$\left\{p-2 - \frac{\ell}{p} + \frac{1}{p}\right\}u + \left\{\frac{p-1}{p} \left(\sum_{i=1}^{p-1} \alpha_i\right) - \frac{1}{p}\right\}t.$$

If  $\alpha_p \neq k$  the coefficient of  $t$  is positive and we need only show that it is at least as great as the negative of the coefficient of  $u$  or in other words that

$$(p-1) \left( \sum_{i=1}^{p-1} \alpha_i \right) + (p-2)p \geq \ell.$$

This follows from the assumption that  $\alpha_p \leq p-2$ .

(v) If  $k \leq p-2$  and  $\alpha_p = k$  then

$$(p-1)u + \gamma \geq u.$$

In this case

$$\gamma \geq -ku.$$

There are circumstances in which the estimates for  $\gamma_i$  and therefore those for  $\gamma$  can be substantially improved. We will discuss them shortly.

Suppose now that  $K/F$  is a totally ramified Galois extension and  $G = \mathfrak{G}(K/F)$  is the direct product of two cyclic groups of order  $p$ . By Lemma 11.1 the sequence of ramification groups is of the form

$$G = G_{-1} = G_0 = G_1 = \dots = G_u \neq G_{u+1} = \dots = G_t \neq G_{t+1} = \{1\}$$

with  $(u, p) = 1$  and  $u \equiv t \pmod{p}$  or of the form

$$G = G_{-1} = G_0 = G_1 = \dots = G_t \neq G_{t+1} = \{1\}$$

with  $(t, p) = 1$ . In the second case we take  $u = t$ . In the first case let  $L_1$  be the fixed field of  $G_t$  and in the second let  $L_1$  be any subfield of  $K$  of degree  $p$  over  $F$ . Let  $L_2$  be any subfield of  $K$  different from  $L_1$  which is also of degree  $p$  over  $F$ . Let  $G^i = \mathfrak{G}(K/L_i)$  and let

$$G^i = G_{s_i}^i \neq G_{s_i+1}^i = \{1\}.$$

Then  $s_1 = t$  and  $s_2 = u$ . According to Proposition IV.4 of Serre's book

$$\delta_{K/F} = (p^2 - p)(u+1) + (p-1)(t+1)$$

and

$$\delta_{K/L_1} = (p-1)(t+1)$$

and

$$\delta_{K/L_2} = (p-1)(u+1).$$

Thus

$$\delta_{L_1/F} = \frac{1}{p} (\delta_{K/F} - \delta_{K/L_1}) = (p-1)(u+1)$$

and

$$\delta_{L_2/F} = \frac{1}{p} (\delta_{K/F} - \delta_{K/L_2}) = \frac{(p-1)}{p} ((p-1)(u+1) + t+1).$$

If  $\overline{G}^i = \mathfrak{G}(L_i/F)$  and

$$\overline{G}^i = \overline{G}_{t_i}^i \neq \overline{G}_{t_i+1}^i = \{1\}$$

then  $t_1 = u$  and

$$t_2 = u + \frac{t-u}{p}.$$

**Lemma 11.7**

Suppose  $\Delta$  belongs to  $K$ ,  $v_K(\Delta) = -u$ , and

$$\Delta^p - \Delta = a$$

belongs to  $L_2$ . If  $Y$  belongs to  $L_2$  then

$$v_{L_1}(S_{K/L_1}(Y\Delta^i)) \geq (p-1)t_2 - it_1 + v_{L_2}(Y)$$

and

$$v_{L_1}(E_{K/L_1}^i(Y\Delta)) \geq (p-1)t_2 + i(v_{L_2}(Y) - t_1)$$

for  $1 \leq i \leq p-1$ .

We show first that if  $\theta$  belongs to  $L_1$  and

$$\theta = \sum_{i=0}^{p-1} Y_i \Delta^i$$

with  $Y_i$  in  $L_2$  then

$$v_{L_2}(Y_i) \geq it_1 + v_{L_1}(\theta)$$

for  $0 \leq i \leq p-1$ . Since  $t_1 = u$  and

$$v_K(\theta) = \min_{0 \leq i \leq p-1} \{v_K(Y_i) - iu\}$$

the inequality is clear for  $i = 0$ . To prove it in general, we use induction on  $i$ . Suppose  $0 < j \leq p-1$  and the inequality is valid for  $i < j$ .

Let

$$pO_F = \mathfrak{P}_F^e.$$

Applying the exercise at the beginning of the paragraph to the extension  $L_2/F$  we see that

$$pe \geq (p-1)t_2 = (p-1) \left( u + \frac{t-u}{p} \right).$$

If  $\xi$  is any  $(p-1)$ th root of unity then, by Lemmas 11.3 and 11.4, there is a  $\sigma$  in  $\overline{G}^2$  such that

$$\Delta^\sigma = \Delta + \xi + O(\varpi_K^{p^2 e - (p-1)u}).$$

We may write

$$\theta^\sigma - \theta = \sum_{i=1}^{p-1} Y_i (\Delta^{i\sigma} - \Delta^i)$$

as a linear combination

$$\sum_{i=0}^{p-1} X_i \Delta^i$$

with coefficients from  $L_2$ . Since

$$v_{L_2}(\theta^\sigma - \theta) \geq v_{L_1}(\theta) + t_1$$

we may apply the induction assumption to see that

$$v_{L_2}(X_{j-1}) \geq (j-1)t_1 + v_{L_1}(\theta^\sigma - \theta) \geq jt_1 + v_{L_1}(\theta).$$

On the other hand

$$\Delta^{i\sigma} - \Delta^i = (\Delta + \xi)^i - \Delta^i + O(\varpi_K^{p^2 e - (p-1)u - (i-1)u})$$

so that  $\theta^\sigma - \theta$  is equal to

$$\sum_{i=1}^{p-1} Y_i \sum_{k=0}^{i-1} \binom{i}{k} \Delta^k \xi^{i-k} + \eta$$

with

$$\eta = O(\theta \varpi_K^{p^2 e - (p-2)u}).$$

Thus if

$$\eta = \sum_{i=0}^{p-1} Z_i \Delta^i$$

with the  $Z_i$  in  $L_2$  we have

$$v_K(Z_{j-1}) \geq (j-1)u + v_K(\Theta) + p^2e - (p-2)u.$$

But

$$p^2e - (p-2)u + (j-1)u \geq p(p-1)u - (p-2)u + (j-1)u$$

which equals

$$((p-1)^2 + j)u \geq pju.$$

Since

$$X_{j-1} = \left( \sum_{i=j}^{p-1} Y_i \binom{i}{j} \xi^{i-j} \right) + Z_{j-1}$$

we have

$$v_{L_2} \left( \sum_{i=j}^{p-1} Y_i \binom{i}{j} \xi^{i-j} \right) \geq ju + v_{L_1}(\theta)$$

for all  $\xi$ . We obtain the required estimate for  $v_{L_2}(Y_j)$  by summing over  $\xi$ .

We now show that

$$v_{L_1}(S_{K/L_1}(Y\Delta^i)) \geq (p-1)t_2 - it_1 + v_{L_2}(Y)$$

for  $Y$  in  $L_2$  and  $1 \leq i \leq p-1$ . All we need do is show that for any  $\theta$  in the inverse different of  $L_1/F$

$$S_{L_1/F}(\theta \varpi_{L_1}^{-v_{L_2}(Y) + it_1 - (p-1)t_2} S_{K/L_1}(Y\Delta^i)) \in O_F$$

or that if  $\theta$  is in  $L_1$  and

$$v_{L_1}(\theta) \geq -(p-1)(t_1+1) + it_1 - (p-1)t_2 - v_{L_2}(Y)$$

then

$$S_{L_1/F}(\theta S_{K/L_1}(Y\Delta^i)) = S_{K/L}(\theta Y\Delta^i) \tag{11.4}$$

is in  $O_F$ .

Let

$$\theta = \sum_{j=0}^{p-1} Y_j \Delta^j$$

with  $Y_j$  in  $L_2$  for  $0 \leq j \leq p-1$ . Then

$$\theta Y \Delta^i = \sum_{j=0}^{p-1-i} Y Y_j \Delta^{j+i} + (a + \Delta) \sum_{j=p-i}^{p-1} Y Y_j \Delta^{j+i-p}.$$

Since

$$\Delta^p - \Delta = a$$

we have

$$E_{K/L_2}^i(\Delta) = 0$$

for  $1 \leq i < p-1$  and

$$E_{K/L_2}^{p-1}(\Delta) = (-1)^p.$$

The relations (11.2) imply that

$$S_{K/L_2}(\Delta^i) = 0$$

for  $1 \leq i < p-1$  and that

$$S_{K/L_2}(\Delta^{p-1}) = p-1.$$

Thus (11.4) is equal to

$$(p-1) S_{L_2/F}(YY_{p-1-i}) + S_{L_2/F}(paYY_{p-i})$$

if  $i < p-1$  and to the sum of this and

$$S_{L_2/F}(YY_{p-1})$$

if  $i = p-1$ .

We know that

$$v_{L_2}(Y_j) \geq jt_1 + v_{L_1}(\theta)$$

for each  $j$ . Thus

$$v_{L_2}(YY_{p-1-i}) \geq (p-1-i)t_1 - (p-1)(t_1+1) + it_1 - (p-1)t_2$$

which is at least  $-(p-1)(t_2+1)$ . So is

$$v_{L_2}(paYY_{p-1}) \geq (p-1)t_2 - t_1 - (p-1)(t_1+1) + it_1 + (p-i)t_1 - (p-1)t_2.$$

If  $i = p-1$

$$v_{L_2}(YY_{p-1}) \geq (p-1)t_1 - (p-1)(t_1+1) + (p-1)t_1 - (p-1)t_2$$

is also at least  $-(p-1)(t_2+1)$ . All we need do now is observe that

$$S_{L_2/F}(\mathfrak{P}_{L_2}^{-(p-1)(t_2+1)}) \subseteq O_F.$$

To complete the proof of the lemma we have to show that

$$v_{L_1}(E_{K/L_1}^i(Y\Delta)) \geq (p-1)t_2 + i(v_{L_2}(Y) - t_1)$$

for  $1 \leq i \leq p-1$ . This has been done for  $i = 1$ ; so we proceed by induction. Applying the relations (11.2) we see that

$$(-1)^{i+1} i E_{K/L_1}^i(Y\Delta) = \sum_{j=0}^{i-1} (-1)^j S_{K/L_1}^{i-j}(Y\Delta) E_{K/L_1}^j(Y\Delta).$$

According to the induction assumption and the first part of the lemma, with  $Y$  replaced by  $Y^{i-j}$ , a typical term in the sum on the right is  $O(\varpi_{L_1}^v)$  with

$$v = (p-1)t_2 - (i-j)t_1 + (i-j)v_{L_2}(Y) + (p-1)t_2 + j(v_{L_2}(Y) - t_1)$$

if  $j > 0$  and

$$v = (p-1)t_2 - it_1 + iv_{L_2}(Y)$$

if  $j = 0$ . The lemma follows.

We apply the second estimate with  $Y = 1$  to improve, when  $\Lambda = \Delta$ ,  $L = L_1$ , and certain auxiliary conditions are satisfied, our estimates on the number  $\gamma$  appearing in (11.3).

(vi) Suppose  $p$  is odd and

$$\ell = (p-1)\nu + j + 1.$$

If  $k \geq \nu + 2$  and  $\alpha_p \leq k - 2$  then

$$jt_1 + \gamma \geq pt_2.$$

If  $k \geq \nu + 2$  and  $\alpha_p \leq k - 1$  then

$$jt_1 + \gamma \geq (p-1)t_2 + t_1$$

and if  $k \geq \nu + 1$  and  $\alpha_p \leq k - 1$

$$jt_1 + \gamma \geq (p-1)t_2 - t_1.$$

In the present circumstances

$$\gamma_i \geq (p-1)t_2 - it_1$$

for  $1 \leq i \leq p-1$ . Thus

$$jt_1 + \gamma \geq jt_1 + \sum_{i=1}^{p-1} \alpha_i((p-1)t_2 - it_1) - \alpha_p t_1$$

which equals

$$jt_1 + (p-1)kt_2 - \ell t_1 - (p-1)\alpha_p(t_2 - t_1)$$

or

$$(p-1)kt_2 - (p-1)\nu t_1 - t_1 - (p-1)\alpha_p(t_2 - t_1).$$

If  $\alpha_p \leq k-2$ , this is at least

$$2(p-1)t_2 + (p-1)(k-2-\nu)t_1 - t_1$$

which in turn is at least  $pt_2$  if  $p \geq 3$  and  $k \geq \nu+2$ . If  $\alpha_p \leq k-1$

$$\gamma \geq (p-1)t_2 + (p-1)(k-1-\nu)t_1 - t_1.$$

The required inequalities follow.

We shall use all these estimates for  $\gamma$  in the next sequence of lemmas.

### Lemma 11.8

If  $\Delta$  is as in Lemma 11.7 and  $p$  is odd then

$$S_{L_1/F}N_{K/L_1}\Delta \equiv S_{L_2/F}N_{K/L_2}\Delta \pmod{\mathfrak{P}_F^{1+t_2}}.$$

The assertion of the lemma may be reformulated as

$$S_{K/L_2}N_{K/L_1}\Delta \equiv S_{K/L_1}N_{K/L_2}\Delta \pmod{\mathfrak{P}_{L_1}^{1+pt_2}}.$$

Notice that

$$pt_2 = t + (p-1)u.$$

Earlier we applied Newton's identity to express  $S_{K/L_1}^p(\Delta)$  in terms of the elementary symmetric functions of  $\Delta$  and its conjugates. Since

$$pe \geq (p-1)t_2$$

we can apply the estimates (iii) for  $\gamma$  to see that

$$S_{K/L_1}^p(\Delta)$$

is congruent to

$$pN_{K/L_1}\Delta + \frac{p}{2} \sum_{j=1}^{p-1} E_{K/L_1}^j(\Delta) E_{K/L_1}^{p-j}(\Delta) + \{S_{K/L_1}(\Delta)\}^p. \quad (11.5)$$

Since

$$\Delta^p - \Delta = a$$

we have

$$S_{K/L_1}(\Delta) = S_{K/L_1}^p(\Delta) - S_{L_2/F}(a).$$

According to Lemma 11.7 the left side belongs to  $\mathfrak{P}_{L_1}^{(p-1)t_2-t_1}$ . In particular it belongs to  $\mathfrak{P}_{L_1}$ . We need to know that it belongs to  $\mathfrak{P}_{L_1}^{1+t_2}$ . This is clear if  $p > 3$  or  $t_2 > t_1$ . To prove it in general we first observe that all terms but the last in (11.5) are congruent to 0 modulo  $\mathfrak{P}_{L_1}^{1+t_2}$ . The middle terms are taken care of by the estimates (ii) for  $\gamma$ . To take care of the first we have to show that

$$pe - u \geq 1 + t_2.$$

We know that  $pe \geq (p-1)t_2$  and that if  $t = u$  the inequality is strict. We need only show that

$$(p-1)t_2 - u \geq t_2$$

with a strict inequality if  $t \neq u$ . This is clear since  $t_2 \geq u$  and  $t_2 > u$  if  $t \neq u$ . Thus

$$S_{K/L_1}\Delta \equiv (S_{K/L_1}\Delta)^p - S_{L_2/F}(a) \pmod{\mathfrak{P}_{L_1}^{1+t_2}}.$$

We now need only show that

$$S_{L_2/F}(a) \equiv 0 \pmod{\mathfrak{P}_{L_1}^{1+t_2}}.$$

The left side belongs to  $\mathfrak{P}_{L_1}^{pb}$  if  $b$  is any integer less than or equal to

$$\frac{-u + (p-1)(t_2+1)}{p}.$$

We may take

$$b \geq \frac{-u + (p-1)t_2}{p}$$

which is greater than or equal to  $\frac{1+t_2}{p}$  except when  $p = 3$  and  $t = u$ . In this case, which is the one to worry about,  $t_2 = u$  is prime to  $p$  and

$$\frac{-u + (p-1)(t_2+1)}{p} = \frac{u+2}{3}$$

has integral part at least  $\frac{u+1}{3}$ .

We apply (11.5) again to see that

$$S_{K/L_1} N_{K/L_2} \Delta = S_{K/L_1} a = S_{K/L_1}^p(\Delta) - S_{K/L_1}(\Delta)$$

is congruent to

$$-S_{K/L_1} \Delta + p N_{K/L_1} \Delta + \frac{p}{2} \sum_{j=2}^{p-2} E_{K/L_1}^j(\Delta) E_{K/L_1}^{p-j}(\Delta).$$

We have still to consider

$$S_{K/L_2} N_{K/L_1} \Delta. \quad (11.6)$$

There are some general remarks to be made first. Suppose  $\Lambda$  belongs to  $K$  and

$$v_K(\Lambda) = -u.$$

If  $x$  and  $z$  also belong to  $K$  and

$$x\Lambda^j \in O_K$$

and

$$z \in \mathfrak{P}_K^{1+t+(p^2-1)u}$$

then

$$N_{K/L_1}(x(\Lambda + z)^{j+1}) \equiv N_{K/L_1}(x\Lambda^{j+1}) \pmod{\mathfrak{P}_{L_1}^{1+pt_2}}.$$

It is enough to show that

$$N_{K/L_1} \left(1 + \frac{z}{\Lambda}\right)^{j+1} \equiv 1 \pmod{\mathfrak{P}_{L_1}^{1+t+pu}}.$$

This follows from Lemma V.5 of Serre's book and the relations

$$1 + t + p^2u \geq 1 + t + pu$$

and

$$\frac{1 + t + p^2u + (p-1)(t+1)}{p} = 1 + t + pu.$$

According to Lemmas 11.3 and 11.4 there is for each  $\sigma \neq 1$  in  $G^2$  a  $(p-1)$ th root of unity  $\xi = \xi(\sigma)$  such that

$$\Delta^\sigma = (\Delta + \xi)^p - a + O(\varpi_K^{2(p^2e-(p-1)u)}).$$

We have

$$p^2 e - (p-1)u \geq (p-1) \{(p-1)u + t\} - (p-1)u$$

which equals

$$(p-1)t + (p-2)(p-1)u \geq t + p(p-2)u.$$

If  $t = u$  the first of these inequalities is strict and if  $t > u$  the last is. Thus

$$p^2 e - (p-1)u \geq 1 + t + p(p-2)u$$

and

$$2(p^2 e - (p-1)u) \geq \{1 + t + (p^2 - 1)u\} + \{1 + t + ((p-1)^2 - 2p)u\}.$$

The second term is positive unless  $p = 3$ .

The expression

$$(\Delta + \xi)^p - a$$

is equal to

$$\Delta + \xi + \sum_{i=1}^{p-1} \binom{p}{i} \xi^i \Delta^{p-i}.$$

But

$$\binom{p}{i} = \frac{p(p-1) \dots (p-i+1)}{i!} \equiv (-1)^{i+1} \frac{p}{i} \pmod{p^2}$$

and

$$2p^2 e - (p-1)u \geq 2(p^2 e - (p-1)u)$$

which is, as we have just seen, at least  $1 + t + (p^2 - 1)u$ . Thus if  $p > 3$

$$\Delta^\sigma \equiv (\Delta + \xi) (1 - Z(\xi)) \pmod{\mathfrak{P}_K^{1+t+(p^2-1)u}}$$

if

$$Z(\xi) = \frac{p\Delta^{p-1}}{1 + \xi/\Delta} \sum_{i=1}^{p-1} \frac{(-1)^i}{i} \left( \frac{\xi}{\Delta} \right)^i.$$

Expanding the denominator we obtain

$$Z(\xi) = p\Delta^{p-1} \sum_{i=1}^{\infty} a_i \left( \frac{\xi}{\Delta} \right)^i.$$

If  $i \geq p-1$

$$a_i = (-1)^i \sum_{j=1}^{p-1} \frac{1}{j} \equiv 0 \pmod{p}.$$

Clearly

$$Z(\xi) = O(p\Delta^{p-2}) = O(\varpi_K^{p^2e-(p-2)u}).$$

If  $p = 3$

$$3(p^2e - (p-1)u) \geq \{1+t+(p^2-1)u\} + \{2(1+t) + (2p^2-6p+1)u\}.$$

The second term is at least  $3u$  and in particular, is positive. Lemmas 11.3 and 11.4 show that

$$\Delta^\sigma \equiv ((\Delta + \xi)^3 - a)^3 - a \pmod{\mathfrak{P}_K^{1+t+(p^2-1)u}}.$$

The right side equals

$$(\Delta + \xi + 3\xi\Delta^2 + 3\xi^2\Delta)^3 - a.$$

Expanding the cube and ignoring all terms in  $\mathfrak{P}_K^{1+t+(p^2-1)u}$  we obtain

$$\Delta + \xi + 3\Delta^3 \left\{ \frac{\xi}{\Delta} + \frac{\xi^2}{\Delta^2} \right\} + 9\Delta^4\xi$$

which we write as

$$(\Delta + \xi)(1 - Z(\xi))$$

with

$$Z(\xi) = 3\Delta^2 \sum_{i=1}^{\infty} a_i \left( \frac{\xi}{\Delta} \right)^i + 9\Delta^4 \sum_{i=1}^{\infty} \left( \frac{-\xi}{\Delta} \right)^i.$$

Since

$$2(p^2e - (p-2)u) \geq 2(p^2e - (p-1)u) + 2u \geq 1+t+p^2u$$

and

$$p^2e - (p-2)u \geq 1+t+(p-1)^2u \geq 1+t+pu$$

for all odd  $p$ , lemma V.5 of Serre's book shows that

$$N_{K/L_1}(x(\Delta + \xi)^{j+1}(1 - Z(\xi))^{j+1}) \equiv \{N_{K/L_1}(x(\Delta + \xi)^{j+1})\} \{1 - S_{K/L_1}Z(\xi)\}^{j+1}$$

modulo  $\mathfrak{P}_{L_1}^{1+t+(p-1)u}$  if  $x\Delta^j$  lies in  $O_K$ .

The expression (11.6) is equal to

$$N_{K/L_1}\Delta + \sum_{\substack{\sigma \in G^2 \\ \sigma \neq 1}} N_{K/L_1}\Delta^\sigma.$$

The preceding remarks show that, if  $p > 3$ , this is congruent to

$$N_{K/L_1} \Delta + \sum_{\xi} N_{K/L_1}(\Delta + \xi) \{1 - S_{K/L_1} Z(\xi)\}$$

modulo  $\mathfrak{P}_{L_1}^{1+t+(p-1)u}$ . Since

$$\frac{2p^2e + u + (p-1)t}{p} \geq 2(p-1) \left( u + \frac{t-u}{p} \right) tu > t + pu$$

we have

$$N_{K/L_1}(\Delta + \xi) S_{K/L_1}(a_i p \Delta^{p-1-i} \xi^i) \in \mathfrak{P}_{L_1}^{1+pt_2}$$

if  $i \geq p$  and we may replace  $S_{K/L_1} Z(\xi)$  by

$$\sum_{i=1}^{p-1} p \xi^i S_{K/L_1}(a_i \Delta^{p-1-i})$$

if  $p > 3$ . Of course

$$N_{K/L_1}(\Delta + \xi) = \sum_{i=0}^p \xi^{1-i} E_{K/L_1}^i(\Delta).$$

Putting these observations together we see that, if  $p > 3$ , (11.6) is congruent modulo  $\mathfrak{P}_{L_1}^{1+pt_2}$  to the sum of

$$N_{K/L_1} \Delta + (p-1) \{S_{K/L_1} \Delta + N_{K/L_1} \Delta\}$$

and

$$-p(p-1) \sum_{i=1}^{p-1} a_i S_{K/L_1}(\Delta^{p-1-i}) E_{K/L_1}^{1+i}(\Delta)$$

and

$$-p(p-1) \{pa_{p-1} S_{K/L_1}(\Delta) + a_{p-2} S_{K/L_1}(\Delta)\}.$$

Since

$$pS_{K/L_1}(\Delta) \in \mathfrak{P}_{L_1}^{1+pt_2}$$

the last expression may be ignored as may the term in the second corresponding to  $i = p-2$ .

Since

$$a_{p-1} = \sum_{j=1}^{p-1} \frac{1}{j} \equiv 0 \pmod{p}$$

and

$$S_{K/L_1}(\Delta^0) = p$$

and

$$3p^2e - t_2 \geq 1 + pt_2$$

the sum in the second expression need only be taken from 1 to  $p-3$ . The relation (11.2) implies that

$$pS_{K/L_1}^{p-1-i}(\Delta) E_{K/L_1}^{1+i}(\Delta) \equiv (-1)^i p(p-1-i) E_{K/L_1}^{p-1-i}(\Delta) E_{K/L_1}^{1+i}(\Delta)$$

modulo  $\mathfrak{P}_{L_1}^{1+pt_2}$ . To complete the proof of Lemma 11.8, for  $p > 3$ , we need only show that

$$ia_{i-1} + (p-i)a_{p-i-1} \equiv (-1)^i \pmod{p}$$

for  $p-2 \geq p-i \geq i \geq 2$ . This amounts to showing that

$$i \sum_{j=1}^{i-1} \frac{1}{j} + (p-i) \sum_{j=1}^{p-i-1} \frac{1}{j} \equiv -1 \pmod{p}.$$

We may replace the  $p-i$  in front of the second sum by  $-i$ . Making the obvious cancellations we obtain

$$-i \sum_{j=i}^{p-i-1} \frac{1}{j} \equiv -1 - i \sum_{j=i}^{p-i} \frac{1}{j}.$$

If  $\frac{1}{j}$  occurs in the sum on the right so does  $\frac{1}{p-j}$ .

The proof for  $p = 3$  can proceed in exactly the same way provided we show that

$$9 \sum \{N_{K/L_1}(\Delta + \xi)\} \{S_{K/L_1}(\xi^i \Delta^{4-i})\} \quad (11.7)$$

lies in  $\mathfrak{P}_{L_1}^{1+3t_2}$  for  $i \geq 1$ . Since

$$2p^2e - u \geq 2(p-1)t_2 - u \geq 3t_2$$

and one of the inequalities is strict

$$9N_{K/L_1}(\Delta + \xi) \in \mathfrak{P}_{L_1}^{1+3t_2}.$$

The expression

$$\xi^i S_{K/L_1}(\Delta^{4-i})$$

is clearly integral for  $i \geq 4$ . By, for example, Lemma 11.7 it is also integral if  $i$  is 2 or 3. Thus  $i = 1$  is the only case to cause a problem. If  $i = 1$  we sum over  $\xi$  to see that (11.7) equals

$$18\{E_{K/L_1}^2(\Delta) S_{K/L_1}(\Delta^3) + S_{K/L_1}(\Delta^3)\}.$$

The terms appearing in the expression in brackets have been shown to lie in  $O_{L_1}$ .

There is one more lemma to be proved before we come to the basic fact of this paragraph. If  $x$  is in  $K$  we set

$$g(x) = S_{L_1/F}(N_{K/L_1} \Delta S_{K/L_1}(x)) - S_{L_2/F}(N_{K/L_2} \Delta S_{K/L_2}(x))$$

and

$$h(x) = S_{L_1/F}(N_{K/L_1}(x\Delta)) - S_{L_2/F}(N_{K/L_2}(x\Delta)).$$

In the following lemma  $p$  is supposed odd.

**Lemma 11.9**

(a) Suppose  $x$  is in  $L_2$ ,  $0 \leq j \leq p-1$ , and  $x\Delta^j$  lies in  $\mathfrak{P}_K^{1+t_2-t_1}$ . If  $j \neq p-2$  then

$$g(x\Delta^j) \equiv 0 \pmod{\mathfrak{P}_F^{1+t_2}}$$

but if  $j = p-2$ , there is an  $\omega$  in  $L_2$  such that

$$\omega x \equiv -x E_{K/L_1}^{p-1}(\Delta) \pmod{\mathfrak{P}_K^{1+pt_2}}$$

and

$$g(x\Delta^j) \equiv -\{S_{L_2/F}x - S_{L_2/F}(x\omega)\} \pmod{\mathfrak{P}_F^{1+t_2}}.$$

(b) Suppose  $x$  is in  $L_2$ ,  $0 \leq j \leq p-1$ , and  $x\Delta^j$  lies in  $\mathfrak{P}_K$ . If  $j \neq p-2$

$$h(x\Delta^j) \equiv 0 \pmod{\mathfrak{P}_F^{1+t_2}}$$

but if  $j = p-2$

$$h(x\Delta^j) \equiv (p-1)(1 - \{E_{K/L_1}^{p-1}(\Delta)\}^p)N_{K/L_1}x$$

modulo  $\mathfrak{P}_{L_1}^{1+pt_2}$ .

The congruences modulo  $\mathfrak{P}_F^{1+t_2}$  are of course equivalent to congruences modulo  $\mathfrak{P}_{L_1}^{1+pt_2}$ . We start with part (a). If  $x$  belongs to  $O_{L_2}$  then

$$g(x) = S_{K/L_1}(xS_{K/L_2}(N_{K/L_1}\Delta) - pxa).$$

Because of the previous lemma this is congruent to

$$S_{K/L_1}(xS_{L_2/F}a - pxa) = S_{L_2/F}xS_{L_2/F}a - pS_{L_2/F}(xa)$$

modulo  $\mathfrak{P}_F^{1+t_2}$ . We saw before that

$$S_{L_2/F}a \in \mathfrak{P}_{L_1}^{1+t_2}.$$

The same argument shows that

$$S_{L_2/F}(xa) \in \mathfrak{P}_{L_1}^{1+t_2}.$$

$p$  belongs to  $\mathfrak{P}_{L_1}^{(p-1)t_2}$ . Since the integral part of

$$\frac{(p-1)(t_2+1)}{p}$$

is at least

$$\frac{(p-1)t_2}{p},$$

so does  $S_{L_2/F}x$ . This takes care of the case  $j = 0$ .

If  $1 \leq j = p-1$  then  $g(x\Delta^j)$  is equal to

$$S_{L_2/F}(xS_{K/L_2}(\Delta^j N_{K/L_1}\Delta)) - (p-1)\delta S_{L_2/F}(xa)$$

where  $\delta = 0$  if  $j \neq p-1$  and  $\delta = 1$  if  $j = p-1$ . Consider

$$Z_j = xS_{K/L_2}(\Delta^j N_{K/L_1}\Delta).$$

It lies in  $L_2$  and is equal to

$$x\Delta^j N_{K/L_1}\Delta + \sum_{\substack{\sigma \in G^2 \\ \sigma \neq 1}} x\Delta^{\sigma j} N_{K/L_1}\Delta^{\sigma}.$$

We observe first of all that if  $\Lambda$  is in  $K$ ,  $v_K(\Lambda) = -u$ ,  $x$  is in  $L_2$ ,  $x\Lambda^j$  lies in  $\mathfrak{P}_K^{1+t_2-t_1}$ , and  $z$  lies in  $\mathfrak{P}_K^{(p-1)(pt_2-t_1)}$  then

$$x(\Lambda + z)^j N_{K/L_1}(\Lambda + z) \equiv x\Lambda^j N_{K/L_1}\Lambda \pmod{\mathfrak{P}_K^{1+pt_2}}$$

provided  $p$  is greater than 3. To establish this congruence we show that

$$\left(1 + \frac{z}{\Lambda}\right)^j N_{K/L_1} \left(1 + \frac{z}{\Lambda}\right) \equiv 1 \pmod{\mathfrak{P}_K^{(p-1)t_2+(p+1)t_1}}.$$

To show this, one has only to observe that  $\frac{z}{\Lambda}$  and all its conjugates lie in  $\mathfrak{P}_K^{(p-1)pt_2-(p-2)t_1}$  and that

$$(p-1)pt_2 - (p-2)t_1 \geq (p-1)t_2 + ((p-1)^2 - (p-2))t_1$$

which equals

$$(p-1)t_2 + ((p-1)(p-2) + 1)t_1 \geq (p-1)t_2 + (p+1)t_1$$

if  $p > 3$ .

Suppose for now that  $p > 3$ . Since

$$p^2e - (p-1)u \geq (p-1)(pt_2 - t_1).$$

Lemma 11.4 implies that  $Z_j$  is congruent to

$$x\Delta^j N_{K/L_1}\Delta + \sum_{\xi} x(\Delta + \xi)^j N_{K/L_1}(\Delta + \xi)$$

modulo  $\mathfrak{P}_K^{1+pt_2}$

$$N_{K/L_1}(\Delta + \xi) = \xi \left\{ 1 + \frac{1}{\xi} N_{K/L_1}\Delta + \sum_{i=1}^{p-1} \xi^{-i} E_{K/L_1}^i(\Delta) \right\}.$$

According to Lemma 11.7 this is congruent to

$$\xi + N_{K/L_1}\Delta + \xi E_{K/L_1}^{p-1}(\Delta)$$

modulo  $\mathfrak{P}_K^{pt_2}$ . Thus if  $x\Delta^j$  belongs to  $\mathfrak{P}_K^{1+t_2-t_1}$

$$Z_j \equiv x\Delta^j N_{K/L_1}\Delta + \sum_{\xi} x(\Delta + \xi)^j (\xi + N_{K/L_1}\Delta + \xi E_{K/L_1}^{p-1}(\Delta))$$

modulo  $\mathfrak{P}_K^{1+pt_2}$ . We expand  $(\Delta + \xi)^j$  and sum over  $\xi$  to obtain

$$px\Delta^j N_{K/L_1}\Delta \tag{11.8}$$

if  $j < p-2$ . If  $j = p-2$  we obtain

$$px\Delta^j N_{K/L_1}\Delta + (p-1)x(1 + E_{K/L_1}^{p-1}(\Delta))$$

and if  $j = p - 1$  we obtain

$$px\Delta^j N_{K/L_1}\Delta + (p-1)x\{N_{K/L_1}\Delta + (p-1)\Delta + (p-1)\Delta E_{K/L_1}^{p-1}(\Delta)\}.$$

The expression (11.8) lies in

$$\mathfrak{P}_K^{1+p^2e-pt_1}$$

provided  $x\Delta^j$  lies in  $\mathcal{P}_K$ .

$$p^2e - pt_1 \geq p(p-1)t_2 - pt_1 \geq pt_2.$$

Since

$$L_2 \cap \mathfrak{P}_K^{1+pt_2} = \mathfrak{P}_{L_1}^{1+t_2}$$

and

$$S_{L_2/F}(\mathfrak{P}_{L_2}^{1+t_2}) \subseteq \mathfrak{P}_F^{1+t_2},$$

we have

$$g(x\Delta^j) \equiv 0 \pmod{\mathfrak{P}_F^{1+t_2}}$$

if  $1 \leq j < p - 2$  and  $x\Delta^j$  lies in  $\mathfrak{P}_K^{1+t_2-t_1}$ .

Since

$$E_{K/L_1}^{p-1}(\Delta)$$

lies in  $O_{L_1}$ ,

$$Z_j = (\omega - 1)x$$

with

$$\omega x = Z_j + x \equiv -x E_{K/L_1}^{p-1}(\Delta) \pmod{\mathfrak{P}_K^{1+pt_2}}$$

if  $j = p - 2$ . We may take  $\omega$  in  $L_2$  and then

$$g(x\Delta^j) \equiv -\{S_{L_2/F}x - S_{L_2/F}(x\omega)\} \pmod{\mathfrak{P}_F^{1+t_2}}.$$

If  $j = p - 1$  then

$$g(x\Delta^j) = S_{L_2/F}(Z_j - (p-1)xa)$$

and

$$Z_j - (p-1)xa$$

is congruent to

$$(p-1)x \{N_{K/L_1} \Delta + p\Delta + (p-1)\Delta E_{K/L_1}^{p-1}(\Delta) - \Delta^p\}$$

modulo  $\mathfrak{P}_K^{1+pt_2}$ . The product

$$\{(p-1)x\} \{p\Delta\}$$

lies in  $\mathfrak{P}_K^{1+pt_2}$  and

$$(p-1) E_{K/L_1}^{p-1}(\Delta) \equiv -E_{K/L_1}^{p-1}(\Delta) \pmod{\mathfrak{P}_K^{1+pt_2}}.$$

It is easily seen that

$$\Delta^p + \Delta E_{K/L_1}^{p-1}(\Delta) - N_{K/L_1} \Delta$$

is equal to

$$- \sum_{i=1}^{p-2} (-1)^i \Delta^{p-i} E_{K/L_1}^i(\Delta).$$

Recalling that  $x\Delta^{p-1}$  is supposed to lie in  $\mathfrak{P}_K$  we appeal to Lemma 11.7 to see that the product of this expression with  $x$  lies in  $\mathfrak{P}_K^{1+pt_2}$ . Thus

$$g(x\Delta^j) \equiv 0 \pmod{\mathfrak{P}_F^{1+t_2}}.$$

If  $p = 3$  and  $\xi = \xi(\sigma)$  then

$$\Delta^\sigma = \Delta + \xi + 3\xi\Delta^2 + 3\xi^2\Delta + z$$

with

$$z = O(\varpi_K^{2(p^2e-(p-1)u)}).$$

If

$$\Delta_\sigma = \Delta + \xi + 3\xi\Delta^2$$

then

$$\Delta^\sigma = \Delta_\sigma + 3\xi^2\Delta + z.$$

If we can show that

$$3\xi^2\Delta + z = O(\varpi_K^{(p-1)t_2+pt_1})$$

it will follow that

$$x\Delta^{\sigma j} N_{K/L_1} \Delta^\sigma \equiv x\Delta_\sigma^j N_{K/L_1} \Delta_\sigma \pmod{\mathfrak{P}_K^{1+pt_2}} \quad (11.9)$$

if  $x\Delta^j$  lies in  $\mathfrak{P}_K^{1+t_2-t_1}$

$$3\xi^2\Delta = O(\varpi_K^{p^2e-t_1})$$

and

$$p^2e - t_1 \geq p(p-1)t_2 - t_1 \geq (p-1)t_2 + pt_1$$

because  $(p-1)^2 \geq p$ . Moreover

$$2(p^2e - (p-1)t_1) \geq 2(p(p-1)t_2 - (p-1)t_1)$$

which is at least

$$(p-1)t_2 + ((2p-1)(p-1) - 2(p-1))t_1$$

and

$$(2p-1)(p-1) - 2(p-1) = (2p-3)(p-1) \geq p.$$

We want to replace  $N_{K/L_1}\Delta_\sigma$  by

$$N_{K/L_1}(\Delta + \xi)$$

in the right side of (11.9). To do this we have to show that

$$N_{K/L_1} \left( \frac{\Delta_\sigma}{\Delta + \xi} \right) \equiv 1 \pmod{\mathcal{P}_K^{(p-1)t_2 + (p+1)t_1}}.$$

Since

$$\frac{\Delta_\sigma}{\Delta + \xi} = 1 + O(\varpi_K^{p^2e-t_1})$$

and

$$p^2e - t_1 \geq p(p-1)t_2 - t_1,$$

we have only to verify that

$$p\{p(p-1)t_2 - t_1\} \geq (p-1)t_2 + (p+1)t_1 \quad (11.10)$$

and that the integral part of

$$\frac{p(p-1)t_2 - t_1 + (p-1)(t+1)}{p} \quad (11.11)$$

is at least

$$\frac{(p-1)t_2 + (p+1)t_1}{p}.$$

The inequality (11.10) is clear. Since  $t \geq t_1$  the integral part of (11.11) is at least

$$\frac{p(p-1)t_2 + (p-2)t_1}{p} \geq \frac{(p-1)t_2 + ((p-1)^2 + (p-2))t_1}{p}$$

and

$$(p-1)^2 + (p-2) \geq p+1.$$

Just as when  $p > 3$  we may replace  $N_{K/L_1}(\Delta + \xi)$  in (11.9) by

$$\xi + N_{K/L_1}\Delta + \xi E_{K/L_1}^{p-1}(\Delta).$$

Thus  $Z_j$  is congruent to

$$x\Delta^j N_{K/L_1}\Delta + \sum_{\xi} x(\Delta + \xi + 3\xi\Delta^2)^j (\xi + N_{K/L_1}\Delta + \xi E_{K/L_1}^2(\Delta))$$

modulo  $\mathfrak{P}_K^{1+pt_2}$  if  $p = 3$ ,  $j$  is 1 or 2, and  $x\Delta^j$  belongs to  $\mathfrak{P}_K^{1+t_2-t_1}$ . If  $j = 1$  this expression is equal to

$$px\Delta^j N_{K/L_1}\Delta + 2x(1 + 3\Delta^2)(1 + E_{K/L_1}^2(\Delta)) \quad (11.12)$$

and if  $j = 2$  it is equal to

$$px\Delta^j N_{K/L_1}\Delta + 2x\{2(1 + 3\Delta^2)\Delta(1 + E_{K/L_1}^2(\Delta)) + (1 + 3\Delta^2)^2 N_{K/L_1}\Delta\}. \quad (11.13)$$

The term

$$px\Delta^j N_{K/L_1}\Delta$$

can be ignored as before because it lies in  $\mathfrak{P}_K^{1+pt_2}$ . Also

$$3x\Delta^{j+1} = O(\varpi_K^{1+p^2e+t_2-2t_1})$$

because  $x\Delta^j$  lies in  $\mathfrak{P}_K^{1+t_2-t_1}$  and

$$p^2e + t_2 - 2t_1 \geq p(p-1)t_2 - t_1 \geq pt_2.$$

We may also replace the factor 2 in (11.12) by 1. Thus (11.12) is congruent to

$$-x(1 + E_{K/L_1}^2(\Delta))$$

modulo  $\mathfrak{P}_K^{1+pt_2}$ . At this point we may argue as we did for  $p > 3$ . To simplify (11.13), we observe that

$$9\Delta^4 N_{K/L_1} \Delta = O(\varpi_K^{2p^2e-7t_1})$$

and that

$$2p^2e - 7t_1 \geq 12t_2 - 7t_1 \geq 3t_2.$$

Moreover

$$3x\Delta^2 N_{K/L_1} \Delta = O(\varpi_K^{1+p^2e-3t_1})$$

if  $x\Delta^2$  belongs to  $\mathfrak{P}_K$  and

$$p^2e - 3t_1 \geq 6t_2 - 3t_1 \geq 3t_2.$$

Thus (11.13) is congruent to

$$2x\{2\Delta(1 + E_{K/L_1}^2(\Delta)) + N_{K/L_1}\Delta\}$$

modulo  $\mathfrak{P}_K^{1+3t_2}$ . We may again argue as we did for  $p > 3$ .

We turn to the second part of the lemma. We observe first that if  $x$  belongs to  $L_2$ ,  $y$  belongs to  $K$ , and

$$xy \in \mathfrak{P}_K$$

then

$$h(xy) \equiv h(y) N_{K/L_1}(x) \pmod{\mathfrak{P}_F^{1+t_2}}.$$

The left side is

$$S_{L_1/F}(N_{K/L_1}x N_{K/L_1}y\Delta) - S_{L_2/F}(x^p N_{K/L_2}y\Delta).$$

Since  $N_{K/L_2}x = N_{L_2/F}x$  lies in  $F$  this equals

$$\{N_{K/L_1}x\}h(y) + S_{L_2/F}\{N_{K/L_2}(y\Delta)(N_{L_2/F}x - x^p)\}.$$

The second term is the trace from  $L_2$  to  $F$  of

$$\{N_{K/L_2}(xy\Delta)\} \left\{ \frac{N_{L_2/F}x - x^p}{N_{K/L_2}x} \right\}$$

if, as we may as well assume,  $x \neq 0$ . All we need do is show that this expression lies in  $\mathfrak{P}_{L_2}^{1+t_2}$  for then its trace will lie in  $\mathfrak{P}_F^{1+t_2}$ . The first factor lies in  $\mathfrak{P}_{L_2}^{1-t_2}$ . The second factor is equal to

$$\left\{ \prod_{\sigma \in \overline{G}^2} x^{\sigma^{-1}} \right\} - 1.$$

Since  $p \geq 3$  it will be sufficient to show that the image of the homomorphism

$$x \longrightarrow \varphi(x) = \prod_{\sigma \in \overline{G}^2} x^{\sigma-1}$$

of  $C_{L_2}$  into  $U_{L_2}$  is contained in  $U_{L_2}^{(p-1)t_2}$ . Let  $\rho$  be a generator of  $\overline{G}^2$  and let  $P(X)$  be the polynomial

$$\sum_{i=1}^{p-1} (X^i - 1) = \sum_{i=0}^{p-1} X^i - p$$

then

$$\varphi(x) = x^{P(\rho)}.$$

Let

$$Q(X) = (X - 1)^{p-1}.$$

If  $1 \leq i \leq p - 1$  the  $i$ th coefficient of  $Q(X)$  is

$$(-1)^{p-1-i} \frac{(p-1) \cdots (p-i)}{i!} \equiv 1 \pmod{p}.$$

Since both  $P(X)$  and  $Q(X)$  are divisible by  $X - 1$

$$P(X) = Q(X) + p(X - 1)R(X)$$

where  $R(X)$  is a polynomial with integral coefficients. For all  $z$  in  $C_{L_2}$ ,

$$z^{\rho-1} = 1 + w$$

with  $w = O(\varpi_{L_2}^{t_2})$ . Then

$$z^{p(\rho-1)} = (1 + w)^p \equiv 1 + w^p \equiv 1 \pmod{\mathfrak{P}_{L_2}^{pt_2}}$$

and

$$z^{p(\rho-1)R(\rho)} \in U_{L_2}^{pt_2}.$$

If  $a \geq 1$  and

$$w \in \mathfrak{P}_{L_2}^a$$

then

$$(1 + w)^{p-1} = \frac{1 + w^p}{1 + w} = 1 + \frac{w^p - w}{1 + w} \equiv 1 \pmod{\mathfrak{P}_{L_2}^{a+t_2}}.$$

One then shows easily by induction that, for all  $z$  in  $C_{L_2}$  and all  $n \geq 1$ ,

$$z^{(\rho-1)^n} \in U_{L_2}^{nt_2}.$$

If  $x$  lies in  $\mathfrak{P}_K$  we may take  $y = 1$ . Applying Lemma 11.8 we see that

$$h(x) \equiv N_{L_2/F} x h(1) \equiv 0 \pmod{\mathfrak{P}_F^{1+t_2}}.$$

If  $1 \leq j \leq p-1$ ,  $x$  lies in  $L_2$ , and  $x\Delta^j$  lies in  $\mathfrak{P}_K$ ,

$$h(x\Delta^j) \equiv P_j - Q_j \pmod{\mathfrak{P}_F^{1+t_2}}$$

with

$$P_j = N_{L_2/F} x S_{L_1/F}(N_{K/L_1} \Delta^{j+1})$$

and

$$Q_j = N_{L_2/F} x S_{L_2/F}(N_{K/L_2} \Delta^{j+1}).$$

The expression  $P_j$  is congruent to

$$N_{L_2/F} x \{N_{K/L_1} \Delta^{j+1} + \sum_{\xi} N_{K/L_1} (\Delta + \xi)^{j+1} \{1 - S_{K/L_1} Z(\xi)\}^{j+1}\} \quad (11.14)$$

modulo  $\mathfrak{P}_{L_1}^{1+pt_2}$ . Since we are working modulo  $\mathfrak{P}_{L_1}^{1+pt_2}$  we need only consider

$$(1 - S_{K/L_1} Z(\xi))^{j+1} \quad (11.15)$$

modulo  $\mathfrak{P}_{L_1}^{pt_2+t_1}$ . Suppose first that  $p > 3$ . Then

$$Z(\xi) = O(\varpi_K^{p^2e-(p-2)u})$$

and

$$p^2e - (p-2)u \geq p(p-1)t_2 - (p-2)u \geq p(p-2)t_2.$$

Moreover the integral part of

$$\frac{p(p-2)t_2 + (p-1)(t+1)}{p}$$

is at least

$$(p-2)t_2 - \frac{(p-1)}{p}t$$

and twice this is at least  $pt_2 + t_1$ . We replace (11.15) by

$$1 - (j+1) S_{K/L_1} Z(\xi).$$

Since

$$Z(\xi) \equiv p\Delta^{p-1} \sum_{i=1}^{p-2} a_i \left(\frac{\xi}{\Delta}\right)^i \pmod{p^2} \quad (11.16)$$

and

$$p^2 = O(\varpi_K^{2p^2e})$$

while

$$2p^2e \geq 2p(p-1)t_2 \geq p(pt_2 + t_1),$$

we may replace  $Z(\xi)$  by the right side of (11.16). By Lemma 11.7

$$pS_{K/L_1}(\Delta^{p-1-i}) = O(\varpi_{L_1}^{pe+it_2})$$

if  $1 \leq i \leq p-2$  and

$$pe + it_2 \geq (p-1)t_2 + it_2 \geq pt_2 + t_1$$

if  $i \geq 2$ . We replace  $Z(\xi)$  by

$$pa_1\xi\Delta^{p-2}.$$

We may write (11.14) as

$$N_{L_2/F}xN_{K/L_1}\Delta^{j+1} \left\{ 1 + \sum_{\xi} N_{K/L_1} \left( 1 + \frac{\xi}{\Delta} \right)^{j+1} \{ 1 - S_{K/L_1}(pa_1\xi\Delta^{p-2}) \} \right\}.$$

When we expand

$$N_{K/L_1} \left( 1 + \frac{\xi}{\Delta} \right)^{j+1}$$

and sum over  $\xi$  we will obtain

$$N_{L_2/F}xN_{K/L_1}\Delta^{j+1} \left\{ 1 + \sum_{\xi} N_{K/L_1} \left( 1 + \frac{\xi}{\Delta} \right)^{j+1} \right\}$$

which we write as

$$N_{L_2/F}x \left\{ N_{K/L_1}\Delta^{j+1} = \sum_{\xi} N_{K/L_1}(\Delta + \xi)^{j+1} \right\}$$

plus a sum of terms of the form

$$\alpha p N_{L_2/F}xN_{K/L_1}\Delta^{j+1} E_{K/L_1}^i \left( \frac{1}{\Delta} \right) S_{K/L_1}(\Delta^{p-2})$$

where  $\alpha$  is rational and lies in  $O_F$  and  $i$  is at least 1. Since

$$E_{K/L_1}^i \left( \frac{1}{\Delta} \right) = O(\varpi_{L_1}^{t_1})$$

for  $i \geq 1$  and

$$pS_{K/L_1}(\Delta^{p-2}) = O(\varpi_{L_1}^{pt_2})$$

these supplementary terms may be ignored.

Now take  $p = 3$ .\*

\*(1998) This is where and how the manuscript of Chapter 11 breaks off.

**Chapter 12.****The Second Main Lemma**

Suppose  $K$  is a normal extension of the local field  $F$  and  $G = \mathfrak{G}(K/F)$  is the direct product of two cyclic groups of prime order  $\ell$ . Let  $\mathcal{X}_K$  be a quasi-character of  $C_K$ . If  $\sigma$  belongs to  $G$  define  $\mathcal{X}_K^\sigma$  by the relation

$$\mathcal{X}_K^\sigma(\alpha) = \mathcal{X}_K(\alpha^{\sigma^{-1}}).$$

Suppose that  $\mathcal{X}_K^\sigma = \mathcal{X}_K$  for all  $\sigma$  in  $G$  but that for no quasi-character  $\mathcal{X}_F$  of  $C_F$  does  $\mathcal{X}_K = \mathcal{X}_{K/F}$ . If  $F \subseteq L \subseteq K$  and  $[K : L] = \ell$  then  $\mathcal{X}_K$  can be extended to a quasi-character of  $W_{K/L}$  because  $W_{K/L}/C_K$  is isomorphic to  $\mathfrak{G}(K/L)$  which is cyclic. If this quasi-character is  $\mathcal{X}_L$  then  $\mathcal{X}_K = \mathcal{X}_{K/L}$ .

**Lemma 12.1**

Suppose  $L_1$  and  $L_2$  are two fields lying between  $F$  and  $K$  and  $[K : L_1] = [K : L_2] = \ell$ . Suppose  $\mathcal{X}_{L_1}$  is a quasi-character of  $C_{L_1}$ ,  $\mathcal{X}_{L_2}$  is a quasi-character of  $C_{L_2}$ , and

$$\mathcal{X}_K = \mathcal{X}_{K/L_1} = \mathcal{X}_{K/L_2}.$$

Then

$$\Delta(\mathcal{X}_{L_1}, \psi_{L_1/F}) \prod_{\mu_F \in S(L_1/F)} \Delta(\mu_F, \psi_F)$$

is equal to

$$\Delta(\mathcal{X}_{L_2}, \psi_{L_2/F}) \prod_{\mu_F \in S(L_2/F)} \Delta(\mu_F, \psi_F).$$

Because of the assumption on  $\mathfrak{G}(K/F)$  the field  $F$  must be non-archimedean. To prove the lemma in general it is enough to prove it for a given  $L_1$  and all  $L_2$ . There are three possibilities to consider.

- (i) The sequence of groups of ramification takes the form

$$G = G_{-1} \neq G_0 = \dots = G_t \neq G_{t+1} = \dots = \{1\}.$$

- (ii) The sequence of groups of ramification takes the form

$$G = G_{-1} = G_0 = G_1 = \dots = G_u \neq G_{u+1} = \dots = G_t \neq G_{t+1} = \dots = \{1\}.$$

(iii) The sequence of groups of ramification takes the form

$$G = G_{-1} = G_0 = G_1 = \dots = G_t \neq G_{t+1} = \dots = \{1\}.$$

In the first two cases we take  $G^1 = \mathfrak{G}(K/L_1)$  to be  $G_t$ . In the third case the choice of  $L_1$  is immaterial.

If the relation  $\mathcal{X}_{L_i}^\sigma = \mathcal{X}_{L_i}$  obtains for one  $\sigma$  different from 1 in  $\overline{G}^i = \mathfrak{G}(L_i/F)$  it obtains for all such  $\sigma$  and  $\mathcal{X}_{L_i}$  is of the form  $\mathcal{X}_{L_i/F}$  for some quasi-character  $\mathcal{X}_F$  of  $C_F$ . Then  $\mathcal{X}_K = \mathcal{X}_{K/F}$  which is contrary to assumption. Thus the characters  $\mathcal{X}_{L_i}^{\sigma-1}$  with  $\sigma$  in  $\overline{G}^i$  are distinct. They are clearly trivial on  $N_{K/L_i} C_K$  so

$$\{\mathcal{X}_{L_i}^{\sigma-1} \mid \sigma \in \overline{G}^i\} = S(K/L_i) = \{\mu_{L_i/F} \mid \mu_F \in S(L_j/F)\}.$$

Here  $j$  is 2 or 1 according as  $i$  is 1 or 2.

Let  $t_i \geq -1$  be that integer for which

$$\overline{G}^i = \overline{G}_{t_i}^i$$

while

$$\overline{G}_{t_i+1}^i = \{1\}.$$

Then

$$\delta_i = \delta(L_i/F) = (t_i + 1)(\ell - 1).$$

In the first case  $L_1/F$  is unramified and  $L_2/F$  is ramified. We choose  $\varpi_{L_2}$  arbitrarily and take  $\varpi_K = \varpi_{L_2}$ . Also we set

$$\varpi_{L_1} = \varpi_F = N_{L_2/F} \varpi_{L_2}.$$

In the second and third cases  $K/L_1$  and  $K/L_2$  are ramified and  $K/F$  is totally ramified. We choose  $\varpi_k$  first and set

$$\varpi_{L_i} = N_{K/L_i} \varpi_K$$

and

$$\varpi_F = N_{K/F} \varpi_K.$$

Let  $m_i = m(\mathcal{X}_{L_i})$ . The  $m(\mathcal{X}_{L_i}^\sigma) = m_i$  and

$$m(\mathcal{X}_{L_i}^{\sigma-1}) \leq m_i.$$

Thus  $m(\nu) \leq m_i$  if  $\nu$  belongs to  $S(K/L_i)$ . If  $G^i = \mathfrak{G}(K/L_i)$  and if

$$G_{u_i}^i = G^i$$

while

$$G_{u_i+1}^i = \{1\}$$

then  $m(\nu) = u_i + 1$  if  $\nu$  is non-trivial. Thus  $u_i + 1 \leq m_i$ . Since  $\nu\mathcal{X}_{L_i}$  is of the form  $\mathcal{X}_{L_i}^\sigma$  for all  $\nu$  in  $S(K/L_i)$ ,

$$m(\nu\mathcal{X}_{L_i}) = m(\mathcal{X}_{L_i}).$$

Lemma 8.8 and 8.12 imply that\*

$$m(\mathcal{X}_K) = \psi_{K/L_i} (m_i - 1) + 1.$$

This  $m(\mathcal{X}_K) = m_i$  if  $K/L_i$  is unramified and

$$m(\mathcal{X}_K) = \ell m_i - \delta(K/L_i)$$

if  $K/L_i$  is ramified. If  $n = n(\psi_F)$  then  $n_i = n(\psi_{L_i/F})$  is  $n$  if  $L_i/F$  is unramified and is  $\ell n + \delta_i$  if  $L_i/F$  is ramified.

In the first case

$$\delta(K/L_2) = \delta(L_1/F) = 0.$$

The relations

$$\delta(K/F) = \delta(K/L_1) + \ell\delta(L_1/F) = \delta(K/L_1) = (t+1)(\ell-1)$$

and

$$\delta(K/F) = \delta(K/L_2) + \delta(L_2/F) = \delta_2 = (t_2+1)(\ell-1)$$

imply that  $t_2 = t$ . Also

$$m(\mathcal{X}_K) = m_2 = \ell m_1 - \delta(K/L_1) = \ell m_1 - \delta_2$$

so that

$$m_2 + n_2 = \ell(m_1 + n_1).$$

Moreover

$$\mathcal{X}_{L_1}(\varpi_{L_1}^{m_1+n_1}) = \mathcal{X}_K(\varpi_{L_2}^{m_1+n_1})$$

---

\* We are encountering once again the conflicting uses of the symbol  $\psi$ .

is equal to

$$\mathcal{X}_{L_2}(\varpi_{L_2}^{m_2+n_2}) = \mathcal{X}_{L_2}(\varpi_F^{m_1+n_1}) \left\{ \mathcal{X}_{L_2} \left( \prod_{\sigma \in \overline{G}^2} \varpi_{L_2}^{1-\sigma} \right) \right\}^{m_1+n_1}$$

and

$$\prod_{\sigma \in \overline{G}_2} \mathcal{X}_{L_2}(\varpi_{L_2}^{1-\sigma}) = \prod_{\mu_F \in S(L_1/F)} \mu_{L_2/F}(\varpi_{L_2})$$

is equal to

$$\prod_{\mu_F \in S(L_1/F)} \mu_F(\varpi_F) = (-1)^{\ell-1}.$$

If

$$S'_i = S(L_i/F) - \{1\}$$

then

$$\prod_{S'_1} \mu_F(\varpi_F^{t_1+1+n}) = (-1)^{n(\ell-1)}$$

and

$$\prod_{S'_2} \mu_F(\varpi_F^{t_2+1+n}) = 1.$$

Thus we have to show that

$$(-1)^{m_1(\ell-1)} \Delta_1(\mathcal{X}_{L_1}, \psi_{L_1/F} \varpi_F^{m_1+n_1})$$

is equal to

$$\Delta_1(\mathcal{X}_{L_2}, \psi_{L_2/F}, \varpi_F^{m_1+n_1}) \prod_{S'_2} \Delta_1(\mu_F, \psi_F, \varpi_F^{t+1+n}).$$

In the second and third cases the relations

$$m(\mathcal{X}_K) = \ell m_1 - \delta(K/L_1) = \ell m_2 - \delta(K/L_2)$$

and

$$\delta(K/F) = \delta(K/L_1) + \ell \delta_1 = \delta(K/L_2) + \ell \delta_2$$

imply that  $m_1 + \delta_1 = m_2 + \delta_2$  and hence that  $m_1 + n_1 = m_2 + n_2$ . Thus

$$\mathcal{X}_{L_1}(\varpi_{L_1}^{m_1+n_2}) = \mathcal{X}_K(\varpi_K^{m_1+n_1}) = \mathcal{X}_{L_2}(\varpi_{L_2}^{m_2+n_2}).$$

Since

$$\prod_{S'_i} \mu_F(\varpi_F^{t_i+1+n}) = 1$$

we have to show that

$$\Delta_1(\mathcal{X}_{L_1}, \psi_{L_1/F}, \varpi_{L_1}^{m_1+n_1}) \prod_{S'_1} \Delta_1(\mu_F, \psi_F, \varpi_F^{t_1+1+n})$$

is equal to

$$\Delta_1(\mathcal{X}_{L_2}, \psi_{L_2/F}, \varpi_{L_2}^{m_2+n_2}) \prod_{S'_2} \Delta_1(\mu_F, \psi_F, \varpi_F^{t_2+1+n}).$$

Suppose  $\mathcal{X}'_F$  is a quasi-character of  $C_F$ . According to Lemma 10.1

$$\Delta(\mathcal{X}'_{L_1/F}, \psi_{L_1/F}) \prod_{\mu_F \in S(L_1/F)} \Delta(\mu_F, \psi_F)$$

is equal to

$$\prod_{\mu_F \in S(L_1/F)} \Delta(\mu_F \mathcal{X}'_F, \psi_F) \quad (12.1)$$

and

$$\Delta(\mathcal{X}'_{L_2/F}, \psi_{L_2/F}) \prod_{\mu_F \in S(L_2/F)} \Delta(\mu_F, \psi_F)$$

is equal to

$$\prod_{\mu_F \in S(L_2/F)} \Delta(\mu_F \mathcal{X}'_F, \psi_F). \quad (12.2)$$

Suppose  $m' = m(\mathcal{X}'_F) = 2d' + \varepsilon'$  and  $d'$  is greater than or equal to both  $1 + t_1$  and  $1 + t_2$ . Choose  $\gamma$  in  $F$  such that

$$\gamma O_F = \mathcal{P}_F^{m'+n}$$

and then choose  $\beta = \beta(\mathcal{X}'_F)$ . By Lemma 9.4 the expression (12.1) is equal to

$$\{\Delta(\mathcal{X}'_F, \psi_F)\}^\ell \left\{ \prod_{\mu_F \in S(L_1/F)} \mu_F \left( \frac{\gamma}{\beta} \right) \right\}$$

and (12.2) is equal to

$$\{\Delta(\mathcal{X}'_F, \psi_F)\}^\ell \left\{ \prod_{\mu_F \in S(L_2/F)} \mu_F \left( \frac{\gamma}{\beta} \right) \right\}.$$

Consequently

$$\Delta(\mathcal{X}'_{L_1/F}, \psi_{L_1/F}) \left\{ \prod_{\mu_F \in S(L_1/F)} \mu_F \left( \frac{\beta}{\gamma} \right) \Delta(\mu_F, \psi_F) \right\}$$

is equal to

$$\Delta(\mathcal{X}'_{L_2/F}, \psi_{L_2/F}) \left\{ \prod_{\mu_F \in S(L_2/F)} \mu_F \left( \frac{\beta}{\gamma} \right) \Delta(\mu_F, \psi_F) \right\}.$$

Suppose that both  $m_1 = m(\mathcal{X}_{L_1})$  and  $m_2 = m(\mathcal{X}_{L_2})$  are at least 2 and let  $m_i = 2d_i + \varepsilon_i$ . Suppose that

$$m(\mathcal{X}_{L_i}^{-1} \mathcal{X}'_{L_i/F}) \leq d_i$$

for  $i$  equal to 1 and 2. Then

$$m_i = m(\mathcal{X}'_{L_i/F}) = \psi_{L_i/F}(m' - 1) + 1.$$

If

$$\mathcal{X}'_{L_i/F}(1+x) = \psi_{L_i/F} \left( \frac{\beta_i x}{\gamma} \right)$$

for  $x$  in  $\mathfrak{P}_{L_i}^{d_i + \varepsilon_i}$  then, by Lemma 9.4 again,

$$\Delta(\mathcal{X}_{L_i}, \psi_{L_i/F}) = \mathcal{X}_{L_i}^{-1} \mathcal{X}'_{L_i/F} \left( \frac{\beta_i}{\gamma} \right) \Delta(\mathcal{X}'_{L_i/F}, \psi_{L_i/F}).$$

Thus to prove Lemma 12.1 in the present circumstances we have only to verify that

$$\mathcal{X}_{L_1}^{-1} \mathcal{X}'_{L_1/F} \left( \frac{\beta_1}{\gamma} \right) \prod_{\mu_F \in S(L_1/F)} \mu_F \left( \frac{\gamma}{\beta} \right)$$

is equal to

$$\mathcal{X}_{L_2}^{-1} \mathcal{X}'_{L_2/F} \left( \frac{\beta_2}{\gamma} \right) \prod_{\mu_F \in S(L_2/F)} \mu_F \left( \frac{\gamma}{\beta} \right).$$

Suppose first that  $\ell$  is odd. Then

$$\prod_{\mu_F \in S(L_i/F)} \mu_F \left( \frac{\gamma}{\beta} \right) = 1$$

and we need only verify that

$$\mathcal{X}_{L_1}^{-1} \left( \frac{\gamma}{\beta_1} \right) \mathcal{X}'_{L_2/F} \left( \frac{\gamma}{\beta_2} \right) = \mathcal{X}_{L_2}^{-1} \left( \frac{\gamma}{\beta_2} \right) \mathcal{X}'_{L_2/F} \left( \frac{\gamma}{\beta_2} \right).$$

According to Lemmas 8.3 and 8.4 we may take  $\beta_1 = \beta_2 = \beta$ .

Certainly

$$\mathcal{X}'_{L_1/F} \left( \frac{\gamma}{\beta} \right) = \mathcal{X}'_F \left( \frac{\gamma^\ell}{\beta^\ell} \right) = \mathcal{X}'_{L_2/F} \left( \frac{\gamma}{\beta} \right).$$

Since  $C_F$  is the product of  $N_{L_1/F} C_{L_1}$  and  $N_{L_2/F} C_{L_2}$  we may write  $\frac{\gamma}{\beta}$  as a product

$$\frac{\gamma}{\beta} = N_{L_1/F} \delta_1 N_{L_2/F} \delta_2.$$

Consider

$$\mathcal{X}_{L_i}(N_{L_j/F} \delta_j) = \mathcal{X}_K(\delta_j)$$

where  $j$  is 1 or 2 according as  $i$  is 2 or 1. The right side equals

$$\mathcal{X}_{L_j}(\delta_j^\ell) = \mathcal{X}_{L_j}(N_{L_j/F} \delta_j) \prod_{\sigma \in \mathfrak{S}(L_j/F)} \mathcal{X}_{L_j}(\delta_j^{1-\sigma}).$$

The product is equal to

$$\prod_{\mu_F \in S(L_i/F)} \mu_{L_j/F}(\delta_j)$$

which is 1 because  $\ell$  is odd.

Before discussing the case  $\ell = 2$  we consider the circumstances under which, for a given  $\mathcal{X}_{L_1}$  and  $\mathcal{X}_{L_2}$ , a quasi-character  $\mathcal{X}'_F$  with the properties described above exists.

**Lemma 12.2**

(a) If  $L_i/F$  is unramified,  $x$  belongs to  $U_{L_i}^{u_i+1}$ , and

$$N_{L_i/F}(x) = 1$$

then

$$\mathcal{X}_{L_i}(x) = 1.$$

(b) If  $L_i/F$  is ramified,  $K/L_i$  is unramified,  $x$  belongs to  $U_{L_i}^{t_i+1}$ , and

$$N_{L_i/F}(x) = 1$$

then

$$\mathcal{X}_{L_i}(x) = 1.$$

(c) If  $L_i/F$  and  $K/L_i$  are ramified,  $x$  belongs to  $U_{L_i}^{u_i+t_i+1}$ , and

$$N_{L_i/F}(x) = 1$$

then

$$\mathcal{X}_{L_i}(x) = 1.$$

Choose some non-trivial  $\sigma_i$  in  $\overline{G}^i = \mathfrak{G}(L_i/F)$ . Then

$$\mu_{L_i} = \mathcal{X}_{L_i}^{\sigma_i^{-1}-1}$$

is a non-trivial character in  $S(K/L_i)$  and

$$m(\mu_{L_i}) = u_i + 1.$$

Since  $L_i/F$  is cyclic there is a  $y$  in  $C_{L_i}$  such that

$$x = y^{\sigma_i^{-1}}.$$

We shall show that  $y$  can be taken in  $U_{L_i}^{u_i+1}$ . Then

$$\mathcal{X}_{L_i}(x) = \mu_{L_i}(y) = 1.$$

Suppose  $L_i/F$  is unramified. If we cannot choose  $y$  in  $U_{L_i}^{u_i+1}$  there is a largest integer  $a \geq -1$  such that we can choose  $y$  in  $U_{L_i}^a$  where  $a$  is of course less than  $u_i + 1$ . Choose such a  $y$ . Then  $a$  is not -1 because we can always divide  $y$  by a power of  $\varpi_F$ . If  $a$  were 0 then  $y$  could not be congruent to an element of  $U_F$  modulo  $\mathfrak{P}_F$ . Then  $y^{\sigma_i^{-1}}$  would not be in  $U_F^1$ . Since  $u_i + 1 > 0$  in the present situation this is impossible. Let

$$y = 1 + \varepsilon \varpi_F^a.$$

Then  $\varepsilon$  cannot be congruent to an element of  $O_F$  modulo  $\mathfrak{P}_F$ . Thus

$$\varepsilon^{\sigma_i} - \varepsilon \not\equiv 0 \pmod{\mathfrak{P}_{L_i}}$$

and

$$y^{\sigma_i^{-1}} \equiv 1 + (\varepsilon^{\sigma_i} - \varepsilon) \varpi_F^a \pmod{\mathfrak{P}_{L_i}^{a+1}}$$

is not in  $U_{L_i}^{a+1}$ . This is a contradiction.

Now suppose  $L_i/F$  is ramified and  $K/L_i$  is unramified. Then  $t_i + 1 \geq 1$  and  $u_i + 1 = 0$ . We need only show that  $y$  can be taken to be a unit. Write

$$y = \varepsilon \varpi_{L_i}^b$$

where  $\varepsilon$  is a unit. If  $b$  is congruent to 0 modulo  $\ell$  we can divide  $y$  by some power of  $\varpi_F$  to obtain an element of  $U_F = U_F^0$ . To see that  $b$  must be congruent to 0 modulo  $\ell$  we suppose the contrary. Then

$$y^{\sigma_i-1} = \varepsilon^{\sigma_i-1} (\varpi_{L_i}^{\sigma_i-1})^b \equiv (\varpi_{L_i}^{\sigma_i-1})^b \pmod{\mathfrak{P}_{L_i}^{t_i+1}}.$$

If  $t_i = 0$  the residue of  $\varpi_{L_i}^{\sigma_i-1}$  modulo  $\mathfrak{P}_{L_i}$  is a non-trivial  $\ell$ th root of unity and

$$(\varpi_{L_i}^{\sigma_i-1})^b \not\equiv 1 \pmod{\mathfrak{P}_{L_i}}.$$

If  $t_i > 0$  then

$$\varpi_{L_i}^{\sigma_i-1} = 1 + \alpha \varpi_{L_i}^{t_i}$$

where  $\alpha$  is a unit. Thus

$$(\varpi_{L_i}^{\sigma_i-1})^b \equiv 1 + \alpha b \varpi_{L_i}^{t_i} \pmod{\mathcal{P}_{L_i}^{t_i+1}}.$$

The right side is not congruent to 0 modulo  $\mathfrak{P}_{L_i}^{t_i+1}$ .

Now suppose  $L_i/F$  and  $K/L_i$  are both ramified. Then  $\ell = p$  and both  $u_i$  and  $t_i$  are at least 1. Again suppose that  $y$  cannot be chosen in  $U_{L_i}^{u_i+1}$  and let  $a$  be the largest integer such that  $y$  can be chosen in  $U^a$ . The argument just used shows that  $a \geq 0$ . Since  $L_i/F$  is ramified

$$U_{L_i}^{k_p} = U_F^k U_{L_i}^{k_p+1}.$$

Therefore  $a$  is not divisible by  $p$  and in particular is at least 1. Let

$$y = 1 + \varepsilon \varpi_{L_i}^a$$

where  $\beta$  is a unit. Then

$$y^{\sigma_i-1} = (1 + \varepsilon^{\sigma_i} \varpi_{L_i}^{a\sigma_i}) (1 + \varepsilon \varpi_{L_i}^a)^{-1}.$$

Let

$$\varepsilon^{\sigma_i} = \varepsilon + \eta \varpi_{L_i}^{t_i+1}$$

and

$$\varpi_{L_i}^{\sigma_i-1} = 1 + \alpha \varpi_{L_i}^{t_i}$$

where  $\alpha$  is a unit. Then  $y^{\sigma_i-1}$  is equal to

$$\{1 + (\varepsilon + \eta \varpi_{L_i}^{t_i+1}) (1 + \alpha \varpi_{L_i}^{t_i})^a \varpi_{L_i}^a\} \{1 + \varepsilon \varpi_{L_i}^a\}^{-1}$$

which is congruent to

$$1 + a\alpha\varepsilon \varpi_{L_i}^{t_i+a}$$

modulo  $\mathfrak{P}_{L_i}^{t_i+a+1}$ . Therefore  $a \geq u_i + 1$ . This is a contradiction.

**Lemma 12.3**

*If  $L_1/F$  is unramified we can choose  $\mathcal{X}'_F$  such that*

$$m(\mathcal{X}_{L_1}^{-1} \mathcal{X}'_{L_1/F}) = t + 1$$

*and*

$$m(\mathcal{X}_{L_2}^{-1} \mathcal{X}'_{L_2/F}) = t + 1.$$

*If  $m(\mathcal{X}_{L_1}) > t + 1$  then  $m(\mathcal{X}'_F)$  will equal  $m(\mathcal{X}_{L_1})$ .*

By the previous lemma we can define a quasi-character  $\mathcal{X}'_F$  of

$$N_{L_1/F} U_{L_1}^{u_1+1}$$

by setting

$$\mathcal{X}'_F(N_{L_1/F} x) = \mathcal{X}_{L_1}(x).$$

We extend  $\mathcal{X}'_F$  to a quasi-character, which we again denote by  $\mathcal{X}'_F$ , of  $C_F$ . Then

$$m(\mathcal{X}_{L_1}^{-1} \mathcal{X}'_{L_1/F}) \leq u_1 + 1.$$

However  $\mathcal{X}_K^{-1} \mathcal{X}'_{K/F}$ ,  $\mathcal{X}_{L_1}^{-1} \mathcal{X}'_{L_1/F}$ , and  $\mathcal{X}_{L_2}^{-1} \mathcal{X}'_{L_2/F}$  satisfy the conditions of Lemma 12.1. Therefore

$$m(\mathcal{X}_{L_1}^{-1} \mathcal{X}'_{L_1/F}) \geq u_1 + 1.$$

Since  $L_1/F$  is unramified  $u_1$  and  $t_2$  are both equal to  $t$ . Thus

$$m(\mathcal{X}_{L_1}^{-1} \mathcal{X}'_{L_1/F}) = t + 1$$

and

$$m(\mathcal{X}_{L_2}^{-1} \mathcal{X}'_{L_2/F}) = \ell(u_1 + 1) - \delta_2 = \ell(u_1 + 1) - (\ell - 1)(t_2 + 1) = t + 1.$$

The last assertion of the lemma is clear.

**Lemma 12.4**

If  $K/F$  is totally ramified then

$$m(\mathcal{X}_{L_i}) \geq t_i + u_i + 1.$$

There exists  $\mathcal{X}'_F$  such that

$$m(\mathcal{X}_{L_i}^{-1} \mathcal{X}'_{L_i/F}) = t_i + u_i + 1$$

for  $i$  equal to 1 and 2.

In the present circumstances  $t_i$  and  $u_i$  are both at least 1. Choose a non-trivial  $\sigma_i$  in  $\overline{G}^i$  and let

$$\mu_{L_i} = \mathcal{X}_{L_i}^{\sigma_i^{-1}-1}$$

as before. Choose  $y$  in  $U_{L_i}^{u_i}$  so that

$$\mu_{L_i}(y) \neq 1.$$

Then

$$\mathcal{X}_{L_i}(y^{\sigma_i-1}) \neq 1.$$

However if

$$y = 1 + \varepsilon \varpi_{L_i}^{u_i}$$

where  $\varepsilon$  is a unit then

$$y^{\sigma_i-1} \equiv 1 + u_i \alpha \varepsilon \varpi_{L_i}^{t_i+u_i} \pmod{\mathfrak{P}_{L_i}^{t_i+u_i+1}}$$

if

$$\varpi_{L_i}^{\sigma_i-1} = 1 + \alpha \varpi_{L_i}^{t_i}.$$

In particular

$$y^{\sigma_i-1} \in U_{L_i}^{t_i+u_i}$$

so that

$$m(\mathcal{X}_{L_i}) \geq t_i + u_i + 1.$$

Just as in the previous lemma we can find a quasi-character  $\mathcal{X}'_F$  of  $C_F$  such that

$$m(\mathcal{X}_{L_1}^{-1} \mathcal{X}'_{L_1/F}) = t_1 + u_1 + 1.$$

We have seen that  $m_1 + \delta_1 = m_2 + \delta_2$ . The same argument shows that

$$m(\mathcal{X}_{L_1}^{-1} \mathcal{X}'_{L_1/F}) + \delta_1 = m(\mathcal{X}_{L_2}^{-1} \mathcal{X}'_{L_2/F}) + \delta_2.$$

To complete the proof of the lemma we show that

$$t_1 + u_1 + \delta_1 = t_2 + u_2 + \delta_2.$$

Since

$$\delta_i = (\ell - 1)(t_i + 1)$$

we have only to show that

$$u_1 + 1 + \ell(t_1 + 1) = u_2 + 1 + \ell(t_2 + 1).$$

Multiplying the left or the right side by  $\ell - 1$  we obtain  $\delta(K/F)$ . The equality follows immediately.

Lemmas 12.3 and 12.4 together with the remarks which provoked them allow us to prove Lemma 12.1 in many, but by no means all, cases. We shall not however apply these lemmas immediately. We shall rather begin the systematic exposition of the proof of Lemma 12.1 taking up the cases to which these lemmas apply in their turn.

Suppose first that  $L_1$  is unramified over  $F$ . As before  $m_i = m(\mathcal{X}_{L_i})$ . Then

$$m_2 = m_1 + (\ell - 1)(m_1 - t - 1) \geq m_1$$

because  $u_1 = t$ . Since the number  $m_1$  is at least  $t + 1$  and  $t \geq 0$  it is at least 1. If  $m_1 = 1$  then  $t = 0$  and  $m_2 = 1$ . Once we have treated this case, as we shall immediately, we may suppose that  $m_2 \geq m_1 > 1$ .

If  $m_2 = 1$  let

$$\lambda = O_{L_2}/\mathfrak{P}_{L_2} = O_F/\mathfrak{P}_F$$

and let

$$\kappa = O_K/\mathfrak{P}_K = O_{L_1}/\mathfrak{P}_{L_1}.$$

$\kappa$  is an extension of  $\lambda$ . The restriction of  $\mathcal{X}_{L_1}$  to  $U_{L_1}$  defines a character  $\mathcal{X}_\lambda$  of  $\lambda^*$  and the restriction of  $\mathcal{X}_{L_2}$  to  $U_K$  defines a character  $\mathcal{X}_\kappa$  of  $\kappa^*$ . The restriction of  $\mathcal{X}_K$  to  $U_K$  defines a character of  $\kappa^*$  which is equal to  $\mathcal{X}_{\kappa/\lambda}$  and to  $\mathcal{X}_\kappa^\ell$  so that

$$\mathcal{X}_\kappa^\ell = \mathcal{X}_{\kappa/\lambda}.$$

As  $\sigma$  varies over  $\overline{G}^2$ ,  $\varpi_{L_2}^{\sigma-1}$ , taken modulo  $\mathcal{P}_{L_2}$ , varies over the  $\ell$ th roots of unity in  $\lambda$  and if

$$\mathcal{X}_{L_2}^{\sigma^{-1}-1} = \nu$$

then

$$\mathcal{X}_\lambda(\varpi_{L_2}^{\sigma-1}) = \nu(\varpi_{L_2}).$$

The right side is not 1 if  $\sigma \neq 1$  because  $\nu$  is then non-trivial. Thus the restriction of  $\mathcal{X}_\lambda$  to the  $\ell$ th roots of unity is not trivial. To every  $\mu_F$  in  $S(L_2/F)$  is associated a character  $\mu_\lambda$  of  $\lambda^*$  which is of order 1 if  $\mu_F = 1$  and of order  $\ell$  otherwise. If  $\psi_\lambda$  is the additive character of  $\lambda$  defined by

$$\psi_\lambda(x) = \psi_F\left(\frac{x}{\varpi_F^{1+n}}\right)$$

then

$$\Delta_1(\mu_F, \psi_F, \varpi_F^{1+n}) = A[-\tau(\mu_\lambda, \psi_\lambda)]$$

if  $\mu_F$  is not trivial. Moreover

$$\psi_{L_2/F}\left(\frac{x}{\varpi_F^{1+n}}\right) = \psi_\lambda(\ell x)$$

and

$$\Delta_1(\mathcal{X}_{L_2}, \psi_{L_2/F}, \varpi_F^{1+n}) = A[-\mathcal{X}_\lambda(\ell)\tau(\mathcal{X}_\lambda, \psi_\lambda)].$$

Finally

$$\Delta_1(\mathcal{X}_{L_1}, \psi_{L_1/F}, \varpi_F^{1+n}) = A[-\tau(\mathcal{X}_\kappa, \psi_{\kappa/\lambda})].$$

Thus the required identity is a consequence of the relation

$$\tau(\mathcal{X}_\kappa, \psi_{\kappa/\lambda}) = \mathcal{X}_\lambda(\ell)\tau(\mathcal{X}_\lambda, \psi_\lambda) \prod_{\mu_\lambda \neq 1} \tau(\mu_\lambda, \psi_\lambda)$$

which we proved as Lemma 7.9.

Retaining the assumption that  $L_1/F$  is unramified we now suppose that  $m_1 > 1$ . There are two possibilities.

(a)

$$m_1 \geq 2(t+1)$$

(b)

$$t+1 \leq m_1 < 2(t+1).$$

The second possibility occurs only when  $t > 0$ .

If  $m_j \geq 2(t+1)$  choose  $\mathcal{X}'_F$  so that

$$m(\mathcal{X}_{L_i}^{-1} \mathcal{X}'_{L_i/F}) = t+1$$

for  $i = 1$  and  $2$ . It is clear that

$$m(\mathcal{X}_{L_1}^{-1} \mathcal{X}'_{L_1/F}) \leq d_1$$

if  $m_i = 2di + \varepsilon_i$ . Since  $m_2 \geq m_1$  we also have

$$m(\mathcal{X}_{L_2}^{-1} \mathcal{X}'_{L_2/F}) \leq d_2.$$

Moreover

$$m' = m(\mathcal{X}'_F) = m_1$$

so that  $d'$  is greater than or equal to both  $1+t_2 = 1+t$  and  $1+t_1 = 0$ . Lemma 12.1 for  $L_1/F$  unramified and  $m_1 \geq 2(t+1)$ , follows immediately if  $\ell$  is odd. Suppose  $\ell = 2$ .

If  $t = 0$  we can invoke Lemmas 8.3 and 8.7 to see that if  $\beta = \beta(\mathcal{X}'_F)$  we may choose  $\beta_1 = \beta(\chi_{L_1/F})$  and  $\beta_2 = \beta(\mathcal{X}'_{L_2/F})$  equal to  $\beta$ . If  $\mu_F^{(1)}$  is the non-trivial element of  $S(L_1/F)$  and  $\mu_F^{(2)}$  is the non-trivial element of  $S(L_2/F)$  we have only to show that

$$\mathcal{X}_{L_1} \begin{pmatrix} \gamma \\ \beta \end{pmatrix} \mathcal{X}'_{L_1/F} \begin{pmatrix} \beta \\ \gamma \end{pmatrix} \mu_F^{(1)} \begin{pmatrix} \gamma \\ \beta \end{pmatrix}$$

is equal to

$$\mathcal{X}_{L_2} \begin{pmatrix} \gamma \\ \beta \end{pmatrix} \mathcal{X}'_{L_2/F} \begin{pmatrix} \beta \\ \gamma \end{pmatrix} \mu_F^{(2)} \begin{pmatrix} \gamma \\ \beta \end{pmatrix}.$$

Certainly

$$\mathcal{X}'_{L_1/F} \begin{pmatrix} \beta \\ \gamma \end{pmatrix} = \mathcal{X}'_{L_2/F} \begin{pmatrix} \beta \\ \gamma \end{pmatrix}$$

and we need only show that if  $\delta$  is in  $C_F$  then

$$\mathcal{X}_{L_1}(\delta) \mu_F^{(1)}(\delta) = \mathcal{X}_{L_2}(\delta) \mu_F^{(2)}(\delta).$$

We may write

$$\delta = N_{L_1/F} \delta_1 N_{L_2/F} \delta_2.$$

Then

$$\mu_F^{(i)}(N_{L_1/F} \delta_i) = 1$$

and, if  $j$  is 1 or 2 according as  $i$  is 2 or 1,

$$\mathcal{X}_{L_i}(N_{L_j/F} \delta_j) = \mathcal{X}_K(\delta_j) = \mathcal{X}_{L_j}(\delta_j^2)$$

which equals

$$\mathcal{X}_{L_j}(N_{L_j/F} \delta_j) \mu_{L_j/F}^{(i)}(\delta_j) = \mathcal{X}_{L_j}(N_{L_j/F} \delta_j) \mu_F^{(i)}(N_{L_j/F} \delta_j).$$

The required equality follows immediately.

If  $t$  is positive we may still choose  $\beta_1 = \beta$ . If  $m_1 - t - 1 = v$  then, by Lemma 8.6, we may choose  $\beta_2$  in the form

$$\beta_2 = \beta + \eta$$

with  $\eta$  in  $\mathfrak{P}_{L_2}^v$ . Since  $v \geq t + 1$

$$\mathcal{X}_{L_2}^{-1}(\beta_2) \mathcal{X}'_{L_2/F}(\beta_2) = \mathcal{X}_{L_2}^{-1}(\beta) \mathcal{X}'_{L_2/F}(\beta).$$

This observation made, we can proceed as before.

Some preparation is necessary before we discuss the second possibility. Suppose that  $t$  is positive so that  $\ell$  is equal to the residual characteristic  $p$ . The finite field  $\lambda_1 = O_{L_1}/\mathcal{P}_{L_1}$  is an extension of degree  $p$  of  $\phi = O_F/\mathcal{P}_F$ .

The map

$$x \longrightarrow x^p - x$$

is an additive endomorphism of  $\phi$  with the prime field as kernel. Choose a  $y$  in  $\phi$  which is not in the image of this map and consider the equation

$$x^p - x = y.$$

If  $x$ , in some extension field of  $\phi$ , satisfies this equation and  $\phi$  has  $q$  elements then  $x^q \neq x$ . However

$$(x^q - x)^p - (x^q - x) = (x^p - x)^q - (x^p - x) = y^q - y = 0.$$

So

$$x^q - x = z$$

where  $z$  is a non-zero element of the prime field. Then

$$x^{q^2} = (x + z)^q = x^q + z = x + 2z$$

and in general

$$x^{q^n} = x + nz.$$

Thus the lowest power  $n$  of  $q$  such that  $x^{q^n} = x$  is  $n = p$  and  $x$  determines an extension of degree  $p$ . Consequently  $x$  may be chosen to lie in  $\lambda_1$  and then  $\lambda_1 = \phi(x)$ .

Let  $E^r(x)$  be the  $r$ th elementary symmetric function of  $x$  and its conjugates. Since

$$x^p - x + (-1)^p N_{\lambda_1/\phi} x = 0 \quad (12.3)$$

we have

$$E^r(x) = 0 \quad (12.4)$$

if  $1 \leq r < p - i$ ,

$$E^{p-1}(x) = (-1)^p \quad (12.5)$$

and, of course,

$$E^p(x) = N_{\lambda_1/\phi} x. \quad (12.6)$$

If  $\lambda$  is a non-zero element of the prime field we can replace  $y$  by  $\lambda y$ . Then  $x$  is to be replaced by  $\lambda x$ . Also we can replace  $x$  by  $x + \lambda$  without changing  $y$ .

Let  $R(L_1)$  be the set of  $(q^p - 1)$ th roots of unity in  $L_1$ . Choose a  $\gamma$  in  $R(L_1)$  whose image in  $\lambda_1$  is  $x$ . If we are dealing with fields of power series  $\gamma$  will also satisfy the equations (12.3), (12.4), (12.5) and (12.6). Let us see how these equations are to be modified for fields of characteristic zero.  $F$  and  $L_1$  are then extensions of the  $p$ -adic field  $\mathbb{Q}_p$ . Let  $F^0$  and  $L_1^0$  be the maximal unramified extensions of  $\mathbb{Q}_p$  contained in  $F$  and  $L_1$  respectively.  $R(L_1)$  is a subset of  $L_1^0$  and  $p$  generates the ideal  $\mathfrak{P}_{F^0}$  and the ideal  $\mathfrak{P}_{L_1^0}$ . Thus

$$\gamma^p - \gamma + (-1)^p N_{L_1/F} \gamma \equiv 0 \pmod{p}$$

and

$$E^r(\gamma) \equiv 0 \pmod{p}$$

if  $1 \leq r < p - 1$  while

$$E^{p-1}(\gamma) \equiv (-1)^p \pmod{p}.$$

Let

$$S^r(\gamma) = \sum_{\sigma \in \mathfrak{S}(L_1/F)} \gamma^{r\sigma}.$$

The following relations are special cases of Newton's formulae.

$$\begin{aligned}
S^1(\gamma) - E^1(\gamma) &= 0 \\
S^2(\gamma) - E^1(\gamma) S^1(\gamma) + 2E^2(\gamma) &= 0 \\
S^3(\gamma) - E^1(\gamma) S^2(\gamma) + E^2(\gamma) S^1(\gamma) - 3E^3(\gamma) &= 0 \\
&\vdots \\
S^{p-1}(\gamma) - E^1(\gamma) S^{p-2}(\gamma) + \dots + (-1)^{p-1}(p-1)E^{p-1}(\gamma) &= 0 \\
S^p(\gamma) - E^1(\gamma) S^{p-1}(\gamma) + \dots + (-1)^p p E^p(\gamma) &= 0.
\end{aligned}$$

We infer that

$$S^r(\gamma) \equiv 0 \pmod{p}$$

if  $1 \leq r < p-1$  and that

$$S^{p-1}(\gamma) \equiv (-1)^p(p-1) E^{p-1}(\gamma) \pmod{p}.$$

Combining the first of these congruences with Newton's formulae we obtain

$$S^r(\gamma) \equiv r(-1)^{r+1} E^r(\gamma) \pmod{p^2}$$

if  $1 \leq r \leq p-1$ . If  $p$  is odd

$$S^p(\gamma) - p E^p(\gamma) \equiv E^1(\gamma) S^{p-1}(\gamma) - E^{p-1}(\gamma) S^1(\gamma) \pmod{p^2}.$$

The right side is equal to

$$E^1(\gamma) (S^{p-1}(\gamma) - E^{p-1}(\gamma)) \equiv 0 \pmod{p^2}.$$

If  $p$  is even

$$S^2(\gamma) + 2E^2(\gamma) = \{E^1(\gamma)\}^2.$$

Since

$$E^1(\gamma) \equiv 1 \pmod{2}$$

we have

$$S^2(\gamma) + 2E^2(\gamma) \equiv 1 \pmod{4}.$$

If  $\sigma \neq 1$  belongs to  $\mathfrak{G}(L_1/F)$  there is a  $(p-1)$ th root of unity  $\zeta$  such that

$$\gamma^\sigma - \gamma \equiv \zeta \pmod{p}.$$

By a suitable choice of  $y$  the root  $\zeta$  can be made to equal, for a given  $\sigma$ , any chosen  $(p-1)$ th root of unity.

The above relations are of course also valid when  $F$  is a field of power series.

Choose a non-trivial character  $\mu_F$  in  $S(L_2/F)$  and choose  $\alpha$  so that

$$\mu_F(1+x) = \psi_F \left( \frac{\alpha x}{\varpi_F^{t+1+n}} \right)$$

if  $x$  is in  $\mathfrak{P}_F^s$ . Here  $s$  is the least integer greater than or equal to  $\frac{t+1}{2}$ . If  $\zeta$  is a  $(p-1)$ th root of unity we define  $\mu_F^\zeta$  to be  $\mu_F^j$  if  $j$  is the unique integer such that

$$\zeta \equiv j \pmod{p}.$$

As we observed in the proof of Lemma 8.5

$$\mu_F^\zeta(1+x) = \psi_F \left( \frac{\alpha \zeta x}{\varpi_F^{1+t+n}} \right)$$

if  $x$  is in  $\mathfrak{P}_F^s$ .

Let  $m_i = 2d_i + \varepsilon_i$  as usual. If  $\beta_1$  in  $L_1$  is such that

$$\mathcal{X}_{L_1}(1+x) = \psi_{L_1/F} \left( \frac{\alpha \beta_1 x}{\varpi_F^{m_1+n_1}} \right)$$

for  $x$  in  $\mathfrak{P}_{L_1}^{d_1+\varepsilon_1}$  then, if  $\sigma \neq 1$  belongs to  $\overline{G}^1 = \mathfrak{G}(L_1/F)$  and  $x$  belongs to  $\mathfrak{P}_{L_1}^{d_1+\varepsilon_1}$ ,

$$\psi_{L_1/F} \left( \frac{\alpha(\beta_1^\sigma - \beta_1)x}{\varpi_F^{m_1+n_2}} \right) = \mathcal{X}_{L_1}^{\sigma-1}(1+x)$$

is equal to

$$\psi_{L_1/F} \left( \frac{\alpha \zeta_\sigma x}{\varpi_F^{1+t+n}} \right)$$

if  $\zeta_\sigma$  is such that

$$\mathcal{X}_{L_1}^{\sigma-1} = \mu_F^{\zeta_\sigma}.$$

Thus if

$$v = m_1 - 1 - t$$

we have

$$\beta_1^\sigma - \beta_1 \equiv \zeta_\sigma \varpi_F^v \pmod{\mathfrak{P}_{L_1}^{d_1}}.$$

It is clear that

$$\zeta_{\sigma\tau} \equiv \zeta_\sigma^\tau + \zeta_\sigma \pmod{\mathfrak{P}_{L_1}}.$$

Suppose

$$\gamma^\sigma - \gamma \equiv \xi_\sigma \pmod{p}$$

where  $\xi_\sigma$  is also a  $(p-1)$ th root of unity. Then

$$\xi_{\sigma\tau} \equiv \xi_\sigma^\tau + \xi_\sigma \pmod{\mathfrak{P}_{L_1}}.$$

We observed that we could arrange that

$$\xi_\sigma = \zeta_\sigma$$

for one non-trivial  $\sigma$ . Once we do this the equality will hold for all  $\sigma$ . Then  $\gamma^{p^\sigma} - \gamma^p \equiv \xi_\sigma \pmod{p}$  and

$$(\beta_1 - \gamma^p \varpi_F^v)^\sigma \equiv \beta_1 - \gamma^p \varpi_F^v \pmod{\mathfrak{P}_{L_1}^{d_1}}$$

for all  $\sigma$  because, as we observed in the proof of Lemma 8.5,  $p$  belongs to  $\mathcal{P}_{L_1}^r$  if  $r + s = t + 1$  and

$$2(r + v) \geq t + 2v = 2m_1 - 2 - 2t + t$$

which is at least

$$(m_1 - 1) + (m_1 - 1 - t) \geq m_1 - 1$$

so that  $r + v \geq d_1$ . Since  $L_1/F$  is unramified there is therefore a  $\beta$  in  $F$  such that

$$\beta_1 - \gamma^p \varpi_F^v \equiv \beta \pmod{\mathfrak{P}_{L_1}^{d_1}}.$$

We may suppose that

$$\beta_1 = \beta + \gamma^p \varpi_F^v.$$

$\beta$  is a unit unless  $v = 0$ . If  $v = 0$  then, by replacing  $\gamma$  by a root of unity congruent to  $\gamma + 1$  modulo  $\mathfrak{P}_{L_1}$  if necessary, we can still arrange that  $\beta$  is a unit.  $\beta$  is congruent to a norm  $N_{L_2/F}\beta'$  modulo  $\mathcal{P}_F^t$ . Since  $d_1 \leq t$  we\*

\*(1998) At the moment this is all that could be found of Chapter 12.

## Chapter Thirteen.

### The Third Main Lemma

Suppose  $K/F$  is Galois and  $G = \mathfrak{G}(K/F)$ . Suppose  $G = HC$  when  $H \neq \{1\}$ ,  $H \cap C = \{1\}$ , and  $C$  is a non-trivial abelian normal subgroup of  $G$  which is contained in every non-trivial normal subgroup of  $G$ .

#### Lemma 13.1

Let  $E$  be the fixed field of  $H$  and let  $\mathcal{X}_F$  be a quasi-character of  $C_F$ . If  $m = m(\mathcal{X}_F)$  then

$$m(\mathcal{X}_{E/F}) = \psi_{E/F}(m-1) + 1.$$

Set

$$m' = m(\mathcal{X}_{E/F}) - 1.$$

Observe that  $m' - 1$  is the greatest lower bound of all real numbers  $v > -1$  such that  $\mathcal{X}_{E/F}$  is trivial on  $U_E^v$  and that  $m - 1$  is the greatest lower bound of all real numbers  $u$  such that  $\mathcal{X}_F$  is trivial on  $U_F^u$ . Since

$$N_{E/F}(U_E^{\psi_{E/F}(u)}) \subseteq U_F^u$$

we see immediately that

$$m' - 1 \leq \psi_{E/F}(m-1).$$

To prove the lemma we need only show that

$$N_{E/F}(U_E^{\psi_{E/F}(m-1)}) \supseteq U_F^{m-1}.$$

We show this with  $m - 1$  replaced by any  $u \geq -1$ .

By Lemma 6.15,  $\tau_{K/F}$  maps  $W_{K/F}^u$  onto  $U_F^u$ . The projection of  $W_{K/F}^u$  on  $G$  is a normal subgroup of  $G$ . Thus it is either  $\{1\}$  or a subgroup containing  $C$ . If it is  $\{1\}$  then

$$W_{K/F}^u = W_{K/F}^u \cap C_K = U_K^{\psi_{K/F}(u)}$$

and

$$U_F^u = N_{K/F}(U_K^{\psi_{K/F}(u)}) = N_{E/F}(N_{K/E}U_K^{\psi_{K/F}(u)})$$

which, by Lemma 6.6, is contained in

$$N_{E/F}(U_E^{\psi_{E/F}(u)}).$$

Suppose the projection is not  $\{1\}$ . If  $L$  is the fixed field of  $C$  the group  $W_{K/F}^u$  contains

$$\{wvw^{-1}v^{-1} \mid w \in W_{K/F}, v \in W_{K/F}^u \cap W_{K/L}\}. \quad (13.1)$$

Since  $C$  is generated by

$$\{\sigma\rho\sigma^{-1}\rho^{-1} \mid \sigma \in G, \rho \in C\}$$

the group generated by the set (13.1) contains a set of representatives for the cosets of  $C_K$  in  $W_{K/L}$ . This group clearly lies in the kernel of  $\tau_{K/F}$ . Thus every element of  $W_{K/F}^u$  is congruent modulo the kernel of  $\tau_{K/F}$  in  $W_{K/F}^u$  to an element of

$$W_{K/F}^u \cap W_{K/E} = W_{K/E}^{\psi_{E/F}(u)}$$

and

$$U_F^u = \tau_{K/F}(W_{K/F}^u) = \tau_{K/F}(W_{K/E}^{\psi_{E/F}(u)})$$

which is

$$N_{E/F}(\tau_{K/E}(W_{K/E}^{\psi_{E/F}(u)}))$$

and this set is contained in

$$N_{E/F}(U_E^{\psi_{E/F}(u)}).$$

Suppose  $F_1$  is non-archimedean,  $K_1/F_1$  is Galois and  $F_1 \subseteq E_1 \subseteq K_1$ . Let  $\mu_1$  be a character of  $\mathfrak{G}(K_1/E_1)$ . We may also regard  $\mu_1$  as a character of  $C_{E_1}$ . Let  $\sigma$  be an element of  $\mathfrak{G}(K_1/F_1)$  and define the character of  $\mu_1^\sigma$  of  $\mathfrak{G}(K_1/E_1^\sigma)$  by

$$\mu_1^\sigma(\rho) = \mu_1(\sigma\rho\sigma^{-1})$$

for  $\rho \in \mathfrak{G}(K_1/E_1^\sigma)$  or, what amounts to the same

$$\mu_1^\sigma(\alpha) = \mu_1(\alpha^{\sigma^{-1}})$$

for  $\alpha \in C_{E_1^\sigma}$ . Since

$$\psi_{E_1^\sigma/F_1}(\alpha) = \psi_{E_1/F_1}(\alpha^{\sigma^{-1}})$$

the next lemma is a congruence of the definitions.

**Lemma 13.2**

$$\Delta(\mu_1^\sigma, \psi_{E_1^\sigma/F_1}) = \Delta(\mu_1, \psi_{E_1/F_1}).$$

We return to the extension  $K/L$  and the group  $G$ . Let  $T$  be a set of representatives for the orbits under  $G$  of the non-trivial characters in  $S(K/L)$ . If  $\mu \in T$  let  $G_\mu$  be the isotropy group of  $\mu$  and let  $F_\mu$  be the fixed field of  $G_\mu$ . Let  $H_\mu = H \cap G_\mu$ . Since  $C$  is contained in  $G_\mu$  we have  $G_\mu = H_\mu \cdot C$ . Then  $\mu$  may also be regarded as a character of  $C$ . Let  $\mu'$  be the character of  $G_\mu$  defined by

$$\mu'(hc) = \mu(c)$$

if  $h \in H_\mu$  and  $c \in C$ . Eventually we must show that

$$\Delta(\mathcal{X}_{E/F}, \psi_{E/F}) \prod_{\mu \in T} \Delta(\mu', \psi_{F_\mu/F}) \quad (13.2)$$

is equal to

$$\Delta(\mathcal{X}_F, \psi_F) \prod_{\mu \in T} \Delta(\mu' \mathcal{X}_{F_\mu/F}, \psi_{F_\mu/F}) \quad (13.3)$$

if  $\mathcal{X}_F$  is a quasi-character of  $C_F$ . At the moment we content ourselves with a special case. The next lemma will be referred to as the Third Main Lemma.

**Lemma 13.3**

*If  $K/F$  is tamely ramified the expressions (13.2) and (13.3) are equal.*

As we observed in Lemma 6.4 the extension  $L/F$  will be unramified and  $\ell = [C : 1]$  will be a prime. Choose a generator  $\varpi_F$  of  $\mathfrak{P}_F$ . Since  $F_\mu/F$  is unramified we may choose  $\varpi_{F_\mu} = \varpi_F$ . Choose  $\varpi_E$  so that  $N_{E/F} \varpi_E = \varpi_F$ . Certainly

$$\delta_{L/F} = \delta_{K/E} = 0$$

while

$$\delta_{K/L} = \ell - 1.$$

Since

$$\delta_{K/F} = \delta_{K/L} + \ell \delta_{L/F} = \delta_{K/E} + \delta_{E/F}$$

we conclude that

$$\delta_{E/F} = \ell - 1.$$

Clearly

$$\sum_{\mu} [F_{\mu} : F] = \sum_{\mu} [H : H_{\mu}] = \sum_{\mu} [G : G_{\mu}]$$

is just the number of non-trivial characters in  $S(K/L)$ , that is  $\ell - 1$ . Moreover  $m(\mu') = 1$ . Let  $E_{\mu}$  be the fixed field of  $H_{\mu}$ . Then

$$N_{E_{\mu}/F_{\mu}}(\varpi_E) = N_{E/F}(\varpi_E) = \varpi_F.$$

Thus, as an element of  $C_{F_{\mu}}$ ,  $\varpi_F$  lies in the image of  $W_{K/E_{\mu}}$  under  $\tau_{K/F_{\mu}}$  and hence  $\mu'(\varpi_F) = 1$ . Also

$$n(\psi_{E/F}) = \ell n(\psi_F) + \delta_{E/F} = \ell n + (\ell - 1)$$

while

$$n(\psi_{F_{\mu}/F}) = n.$$

If  $m = m(\mathcal{X}_F) = 0$  then

$$m(\mathcal{X}_{E/F}) = m(\mathcal{X}_{F_{\mu}/F}) = 0$$

and

$$\mathcal{X}_{E/F}(\varpi_E^{\ell n + \ell - 1}) = \mathcal{X}_F(\varpi_F^{\ell n + \ell - 1}) = \mathcal{X}_F(\varpi_F^n) \prod_{\mu} \mathcal{X}_{F_{\mu}/F}(\varpi_F^{1+n})$$

so that the lemma amounts to the equality

$$\prod_{\mu} \Delta_1(\mu, \psi_{F_{\mu}/F}, \varpi_F^{1+n}) = \prod_{\mu} \Delta_1(\mu, \psi_{F_{\mu}/F}, \varpi_F^{1+n}).$$

If  $m > 0$  then, by Lemma 6.4,

$$m(\mathcal{X}_{E/F}) = \ell m - (\ell - 1)$$

and

$$m(\mathcal{X}_{E/F}) + n(\psi_{E/F}) = \ell(m + n).$$

Since  $K/E$  is unramified

$$m(\mathcal{X}_{K/F}) = m(\mathcal{X}_{E/F}) = \ell m - (\ell - 1).$$

However

$$\mathcal{X}_{K/F} = (\mu' \mathcal{X}_{F_{\mu}/F})_{K/F_{\mu}}$$

so that

$$\psi_{K/F_\mu}(m(\mu' \mathcal{X}_{F_\mu/F}) - 1) \geq m(\mathcal{X}_{K/F}) - 1 = \ell(m - 1)$$

or

$$m(\mu' \mathcal{X}_{F_\mu/F}) - 1 \geq \varphi_{K/F_\mu}(\ell(m - 1)) = m - 1.$$

Consequently

$$m(\mu' \mathcal{X}_{F_\mu/F}) \geq m.$$

Since it is clearly less than or equal to  $m$  it is equal to  $m$ . Because

$$\mathcal{X}_{E/F}(\varpi_F^{m+n}) = \mathcal{X}_F(\varpi_F^{\ell(m+n)}) = \mathcal{X}_F(\varpi_F^{m+n}) \prod_{\mu} \mathcal{X}_{F_\mu/F}(\varpi_F^{m+n})$$

we have to show that

$$\Delta_1(\mathcal{X}_{E/F}, \psi_{E/F}, \varpi_F^{m+n}) \prod \Delta_1(\mu', \psi_{F_\mu/F}, \varpi_F^{m+n})$$

is equal to

$$\Delta_1(\mathcal{X}_F, \psi_F, \varpi_F^{m+n}) \prod \Delta_1(\mu' \mathcal{X}_{F_\mu/F}, \psi_{F_\mu/F}, \varpi_F^{m+n}).$$

Let  $\phi$  be the field  $O_F/\mathcal{P}_F$ , let  $\lambda = O_L/\mathcal{P}_L$ , let  $q$  be the number of elements in  $\phi$ , and let

$$f = [\lambda : \phi] = [L : F].$$

Let  $\theta$  be the homomorphism of  $C$  into  $\lambda^*$  introduced in Chapter IV of Serre's book. Thus

$$\theta(c) = \varpi_E^{c-1} \pmod{\mathfrak{P}_F}$$

so that if  $h \in H$

$$\theta(h^{-1}ch) \equiv (\varpi_E^{h^{-1}c-h^{-1}}) \equiv (\varpi_E^{c-1})^h \equiv \theta(c)^h.$$

Let  $h_0$  be that element of  $H$  such that

$$\alpha^{h_0} = \alpha^q$$

if  $\alpha \in \lambda$  and let  $c_0$  be a generator of  $C$ . Then  $\theta(c_0)$  has order  $\ell$  and, since the centralizer of  $C$  in  $H$  is  $\{1\}$ ,

$$\theta(h_0^{-r}ch_0^r) = \theta(c_0)^{q^r}$$

is  $\theta(c_0)$  if and only if  $f$  divides  $r$ . On the other hand, it is  $\theta(c_0)$  if and only if  $\ell$  divides  $q^r - 1$ . Thus the order of  $q$  modulo  $\ell$  is  $f$ . We also observe that both  $C$  and its dual group are cyclic of prime order so that any element of  $H$  which fixed an element of  $T$  would act trivially on the dual group and therefore on  $C$  itself. It follows that  $F_\mu = L$  for all  $\mu$  in  $T$ .

Suppose first that  $m = 1$ . Let  $\psi_\phi$  be the character

$$\psi_\phi(x) = \psi_F \left( \frac{x}{\varpi_F^{1+n}} \right)$$

on  $\phi$ . Since  $O_E/\mathfrak{P}_E$  is naturally isomorphic to  $O_F/\mathfrak{P}_F$  and the map  $x \rightarrow N_{E/F}x$  gives the map  $x \rightarrow x^\ell$  of  $\phi$  into itself while the map  $x \rightarrow S_{E/F}x$  induces the map  $x \rightarrow \ell x$  the required identity reduces to the equality of

$$\mathcal{X}_\phi(\ell^\ell) \tau(\mathcal{X}_\phi^\ell, \psi_\phi) \prod_{\mu \in T} \tau(\mu_\lambda, \psi_{\lambda/\phi})$$

and

$$\tau(\mathcal{X}_\phi, \psi_\phi) \prod_{\mu \in T} \tau(\mu_\lambda \mathcal{X}_{\lambda/\phi}, \psi_{\lambda/\phi}).$$

This equality has been proved in Lemma 7.8.

Now let  $m$  be greater than 1. Since  $F_\mu = 1$  for all  $\mu$  we are trying to show that

$$\Delta_1(\mathcal{X}_{E/F}, \psi_{E/F}, \varpi_F^{m+n}) \prod \Delta_1(\mu, \psi_{L/F}, \varpi_F^{m+n})$$

is equal to

$$\Delta_1(\mathcal{X}_F, \psi_F, \varpi_F^{m+n}) \prod \Delta_1(\mu \mathcal{X}_{L/F}, \psi_{L/F}, \varpi_F^{m+n}).$$

Since the action of  $H$  on  $C$  is not trivial  $\ell$  cannot be 2. If  $\mu$  lies in  $T$  and  $\mu^{-1}$  lies in the orbit of  $\nu$  then

$$\Delta_1(\nu, \psi_{L/F}, \varpi_F^{m+n}) = \Delta_1(\mu^{-1}, \psi_{L/F}, \varpi_F^{m+n})$$

is  $\mu(-1)$  times the complex conjugate of

$$\Delta_1(\mu, \psi_{L/F}, \varpi_F^{m+n}).$$

Since the order of  $\mu$  is  $\ell$ ,  $\mu(-1) = 1$  and, if  $\mu \neq \nu$ , the product of the two terms corresponding to  $\mu$  and  $\nu$  is 1. If

$$\mu^{-1} = \mu^{q^r}$$

with  $0 \leq r < f$  lies in the orbit of  $\mu$  then  $\ell$  divides  $q^r + 1$ . Thus  $\ell$  divides  $q^{2r} - 1$  and  $2r = f$ . By Lemma 7.1

$$|\tau(\mu_\lambda, \psi_{\lambda/\phi})| = \sqrt{q}^f = q^r$$

and

$$\tau(\mu_\lambda, \psi_{\lambda/\phi}) = -\Delta_1(\mu, \psi_{L/F}, \varpi_F^{1+n}) q^r$$

if  $\psi_{\lambda/\phi}$  has the same meaning as before and  $\mu_\lambda$  is the character of  $\lambda^*$  induced by  $\mu$ . Since

$$\delta = \Delta_1(\mu, \psi_{L/F}, \varpi_F^{1+n})$$

is its own complex conjugate, it is  $\pm 1$ . If  $\alpha \in \phi$  then

$$\mu^{-1}(\alpha) = \mu(\alpha^{q^r}) = \mu(\alpha).$$

Since  $u(\alpha)$  is an  $\ell$ th root of unity it is 1. Thus

$$\tau(\mu_\lambda, \psi_{\lambda/\phi}) = \tau(\mu_\lambda).$$

However it follows from Lemma 7.1 that

$$\tau(\mu_\lambda) \equiv 1 \pmod{\eta}$$

where  $\eta$  is a number in  $\mathfrak{k}_{p(q^f-1)}$  which is not a unit and whose only prime divisors are divisors of  $\ell$ . Thus

$$-\delta q^r = \tau(\mu_\lambda) \equiv 1 \pmod{\ell}$$

and  $\delta = 1$ . We are reduced to showing that

$$\Delta_1(\mathcal{X}_{E/F}, \psi_{E/F}, \varpi_F^{m+n})$$

is equal to

$$\Delta_1(\mathcal{X}_F, \psi_F, \varpi_F^{m+n}) \prod \Delta_1(\mu \mathcal{X}_{L/F}, \psi_{L/F}, \varpi_F^{m+n})$$

Let  $\beta = \beta(\mathcal{X}_F)$ . By repeated applications of Lemma 8.9 we see that we may take

$$\beta(\mathcal{X}_{L/F}) = \beta(\mathcal{X}_{K/F}) = \beta(\mu \mathcal{X}_{L/F}) = \beta.$$

If  $\beta(\mathcal{X}_{E/F})$  is chosen we could also take

$$\beta(\mathcal{X}_{K/F}) = \beta(\mathcal{X}_{E/F}).$$

Thus if

$$m' = m(\mathcal{X}_{E/F}) = m(\mathcal{X}_{K/F}) = 2d' + \varepsilon'$$

we have

$$\beta \equiv \beta(\mathcal{X}_{E/F}) \pmod{\mathfrak{P}_K^{d'}}.$$

Since both sides of the congruence lie in  $E$

$$\beta \equiv \beta(\mathcal{X}_{E/F}) \pmod{\mathfrak{P}_E^{d'}}$$

and we may take

$$\beta(\mathcal{X}_{E/F}) = \beta.$$

Then

$$\Delta_2(\mathcal{X}_{E/F}, \psi_{E/F}, \varpi_F^{m+n}) = \psi_F \left( \frac{\ell\beta}{\varpi_F^{m+n}} \right) \mathcal{X}_F^{-1}(\beta^\ell)$$

while

$$\Delta_2(\mathcal{X}_F, \psi_F, \varpi_F^{m+n}) \prod_{\mu \in T} \Delta_2(\mu\mathcal{X}_F, \psi_{L/F}, \varpi_F^{m+n})$$

is equal to

$$\psi_F \left( \frac{\ell\beta}{\varpi_F^{m+n}} \right) \mathcal{X}_F^{-1}(\beta^\ell).$$

To complete the proof of the lemma we have to show that

$$\Delta_3(\mathcal{X}_F, \psi_F, \varpi_F^{m+n}) \prod_{\mu \in T} \Delta_3(\mu\mathcal{X}_F, \psi_{L/F}, \varpi_F^{m+n}) \quad (13.4)$$

is equal to

$$\Delta_3(\mathcal{X}_{E/F}, \psi_{E/F}, \varpi_F^{m+n})$$

when one, and hence both, of  $m$  and  $m'$  is odd.

As remarked in Lemma 9.4

$$\Delta_3(\mu\mathcal{X}_{L/F}, \psi_{L/F}, \varpi_F^{m+n}) = \Delta_3(\mathcal{X}_{L/F}, \psi_{L/F}, \varpi_F^{m+n}).$$

According to Lemma 9.6 the right side is equal to

$$\varepsilon \Delta_3(\mathcal{X}_F, \psi_F, \varpi_F^{m+n})^{[L:F]}$$

where  $\varepsilon$  is 1 if  $f = [L : F]$  is odd and -1 if it is even. Thus (13.4) is equal to

$$\varepsilon^{\frac{\ell-1}{f}} \{ \Delta_3(\mathcal{X}_F, \psi_F, \varpi_F^{m+n}) \}.$$

As before

$$\phi = O_F/\mathfrak{P}_F = O_E/\mathfrak{P}_E.$$

Let  $\varphi_\phi$  be the function on  $\phi$  defined by

$$\varphi_\phi(x) = \psi_F \left( \frac{\beta x}{\varpi_F^{d+1+n}} \right) \mathcal{X}_F^{-1}(1 + \varpi_F^d x)$$

if  $m = 2d + 1$ . Then  $m' = 2\ell d + 1$  so that  $d' = \ell d$ . Let  $\varphi'_\phi$  be the function on  $\phi$  defined by

$$\varphi'_\phi(x) = \psi_{E/F} \left( \frac{\beta x}{\varpi_F^{d+1+n}} \right) \mathcal{X}_{E/F}^{-1}(1 + \varpi_F^d x).$$

Because of Lemma 9.3, to complete the proof of the lemma we have only to show that

$$\varepsilon^{\frac{\ell-1}{f}} A[\sigma(\varphi_\phi)^\ell] = A[\sigma(\varphi'_\phi)].$$

Since  $d' \geq m$  and

$$\frac{3d' + \ell - 1}{\ell} \geq m$$

we have

$$N_{K/L}(1 + \varpi_F^d x) \equiv 1 + \varpi_F^d S_{K/L} x + \varpi_F^{2d} E_{K/L}^2(x) \pmod{\mathfrak{P}_L^m}$$

if  $E_{K/L}^2(x)$  is the second elementary symmetric function of  $x$  and its conjugates over  $L$ . Thus

$$N_{E/F}(1 + \varpi_F^d x) \equiv 1 + \varpi_F^d S_{E/F} x + \varpi_F^{2d} E_{E/F}^2(x) \pmod{\mathfrak{P}_F^m}.$$

This in turn is congruent to

$$(1 + \varpi_F^d S_{E/F} x) (1 + \varpi_F^{2d} E_{K/F}^2(x)).$$

Thus

$$\varphi'_\phi(x) = \varphi_\phi(\ell x) \psi_\phi(-E_{\lambda/\phi}^2(x))$$

if

$$\psi_\phi(x) = \varphi_F \left( \frac{\beta x}{\varpi_F^{1+n}} \right)$$

or

$$\varphi'_\phi(x) = \varphi_\phi(\ell x) \psi_\phi \left( \frac{-\ell(\ell-1)}{2} x^2 \right) = \{\varphi_\phi(x)\}^\ell.$$

Suppose first that  $p$  is odd and let

$$\varphi_\phi(x) = \psi_\phi \left( \frac{x^2 - 2\alpha x}{2} \right)$$

so that

$$\varphi'_\phi(x) = \psi_\phi \left( \frac{\ell x^2 - 2\ell\alpha x}{2} \right) = \psi_\phi \left( \frac{\ell(x - \alpha)^2}{2} \right) \psi_\phi \left( \frac{-\ell\alpha^2}{2} \right).$$

Referring to the observations in paragraph 9 we see that we must show that

$$\varepsilon^{\frac{\ell-1}{f}} \nu_\phi(-1)^{\frac{\ell-1}{2}} \psi_\phi \left( \frac{-\ell\alpha^2}{2} \right) = \nu_\phi(\ell) \psi_\phi \left( \frac{-\ell\alpha^2}{2} \right)$$

or

$$\varepsilon^{\frac{\ell-1}{f}} = \nu_\phi(-1)^{\frac{\ell-1}{2}} \nu_\phi(\ell)$$

if  $\nu_\phi$  is the quadratic character of  $\phi^*$ . Let  $q$  be the number of elements in  $\phi$ . If  $q$  is an even power of  $p$  the right side is 1 and if  $q$  is an odd power of  $p$  the right side is, by the law of quadratic reciprocity,  $\omega(p)$  if  $\omega$  is the quadratic character of the field with  $\ell$  elements. Thus in all cases the right side is  $\omega(q)$ . If  $f$  is odd then  $q^f$  is a quadratic residue of  $\ell$  if and only if  $q$  is. Since

$$q^f - 1 \equiv 0 \pmod{\ell}.$$

$q$  is a quadratic residue and both sides of the equation are 1. If  $f$  is even the left side is  $(-1)^{\frac{\ell-1}{f}}$ . Since  $f$  is the order of  $q$  modulo  $\ell$  this is  $\omega(q)$ .

Now suppose that  $p = 2$ . If

$$\psi_\phi(-x^2) = \psi_\phi(\alpha x)$$

then, by the remarks in the proof of Lemma 9.7, we have to show that

$$\varepsilon^{\frac{\ell-1}{f}} \varphi_\phi(\alpha)^{\frac{\ell-1}{2}} = 1$$

if  $\ell \equiv 1 \pmod{4}$  and that

$$\varepsilon^{\frac{\ell-1}{f}} \varphi_\phi(\alpha)^{\frac{\ell+1}{2}} = 1$$

if  $\ell \equiv 3 \pmod{4}$ . We also saw in paragraph 9 that

$$\{\varphi_\phi(\alpha)\}^2 = \psi_\phi(\alpha^2)$$

was +1 or -1 according as  $q$  is or is not an even power of  $p$ . By the second supplement to the law of quadratic reciprocity

$$\varphi_\phi(\alpha)^{\frac{\ell-1}{2}} = \omega(q)$$

if  $\ell \equiv 1 \pmod{4}$  and

$$\varphi_\phi(\alpha)^{\frac{\ell+1}{2}} = \omega(q)$$

if  $\ell \equiv 3 \pmod{4}$ . We have just seen that

$$\varepsilon^{\frac{\ell-1}{f}} = \omega(q).$$

The lemma is proved.

## Chapter Fourteen.

### The Fourth Main Lemma.

In the previous paragraph we said that we would eventually have to show that

$$\Delta(\chi_{E/F}, \psi_{E/F}) \prod_{\mu \in T} \Delta(\mu', \psi_{F_\mu/F}) \quad (14.1)$$

is equal to

$$\Delta(\chi_F, \psi_F) \prod_{\mu \in T} \Delta(\mu' \chi_{F_\mu/F}, \psi_{F_\mu/F}). \quad (14.2)$$

However we verified that the two expressions are equal only when  $K/F$  is tamely ramified. In this paragraph we shall show that they are equal if Theorem 2.1 is valid for all pairs  $K'/F'$  in  $\mathcal{P}(K/F)$  for which  $[K' : F'] < [K : F]$ .

#### Lemma 14.1

*Suppose  $K/F$  is wildly ramified and Theorem 2.1 is valid for all pairs  $K'/F'$  in  $\mathcal{P}(K/F)$  for which  $[K' : F'] < [K : F]$ . If  $\chi_F$  is any quasi-character of  $C_F$  the expressions (14.1) and (14.2) are equal.*

If  $a$  and  $b$  are two non-zero complex numbers and  $m$  is a positive integer we again write  $a \sim_m b$  if, for some non-negative integer  $r$ ,  $\frac{a}{b}$  is an  $m^r$ th root of unity. Define the non-zero complex number  $\rho$  by demanding that

$$\Delta(\chi_{E/F}, \psi_{E/F}) \prod_{\mu \in T} \Delta(\mu', \psi_{F_\mu/F})$$

be equal to

$$\rho \Delta(\chi_F, \psi_F) \prod_{\mu \in T} \Delta(\mu' \chi_{F_\mu/F}, \psi_{F_\mu/F}).$$

We have to show that  $\rho = 1$ . Lemma 14.1 will be an easy consequence of the following four lemmas.

#### Lemma 14.2

*If  $m(\chi_F)$  is 0 or 1 then  $\rho = 1$  and in all cases  $\rho \sim_{2p} 1$ .*

#### Lemma 14.3

*If  $[G : G_1]$  is a power of 2 then  $\rho \sim_p 1$ .*

**Lemma 14.4**

*If the induction assumption is valid, if  $F \subseteq F' \subseteq L$ , if  $F'/F$  is normal, and if  $[F' : F] = \ell$  is a prime then  $\rho \sim_\ell 1$ .*

**Lemma 14.5**

*Suppose  $H = H_1 H_2$  where  $H_2$  is a cyclic normal subgroup of  $H$ ,  $[H_2 : 1]$  is a power of a prime  $\ell$ , and  $[H_1 : 1]$  is prime to  $\ell$ . If the induction assumption is valid  $\rho \sim_\ell 1$ .*

Grant these four lemmas for a moment and observe that if  $m$  and  $n$  are relatively prime then  $\rho \sim_m 1$  and  $\rho \sim_n 1$  imply that  $\rho = 1$ . If  $\ell$  is a prime which divides  $[G : G_0]$  there is a field  $F'$  containing  $F$  and contained in  $L$  so that  $F'/F$  is normal and  $[F' : F] = \ell$ . Thus Lemma 14.1 follows from Lemma 14.4 unless  $[G : G_0]$  is a prime power. Lemma 14.1 follows from Lemmas 14.2 and 14.4 unless  $[G : G_0]$  is a power of 2 or  $p$ . Suppose  $[G : G_0]$  is a power of 2 or  $p$ . Then  $\rho \sim_{[G:G_0]} 1$  except perhaps when  $[G : G_0] = 1$ . If  $\ell$  is a prime which does not divide  $[G : G_0]$  but does divide  $[G_0 : G_1]$  let  $H_2$  be the  $\ell$ -Sylow subgroup of  $G_0/G_1$ .  $H_2$  is a normal subgroup of  $G/G_1$  which we may identify with  $H$  and  $H/H_2$  has order prime to  $H_2$ . Thus, by a well-known theorem of Schur [7],  $H = H_1 H_2$  where  $H_1 \cap H_2 = \{1\}$  and  $H_1$  has order prime to  $H_2$ . It follows from Lemma 14.5 that  $\rho = 1$  unless  $[G : G_0] = 1$  or  $[G : G_1]$  is a power of 2 or  $p$ . If  $[G : G_0] = 1$  and  $\ell$  is a prime dividing  $[G_0 : G_1]$  there is a field  $F'$  with  $F \subseteq F' \subseteq L$  such that  $F'/F$  is normal and  $[F' : F] = \ell$ . Thus if  $[G : G_0] = 1$  it follows from Lemma 14.4 that  $\rho = 1$  unless  $[G : G_1]$  is a power of 2. However if  $[G : G_1]$  is a power of 2 there certainly is an  $F'$  in  $L$  with  $[F' : F] = 2$ . It follows from Lemmas 14.3 and 14.4 that  $\rho = 1$  in this case unless  $p = 2$ . If  $[G : G_1]$  is a power of  $p$  then  $G_0 = G_1$  and  $G/G_1$  is abelian. By assumption the abelian  $p$ -group  $G/G_1$  acts on the  $p$ -group  $C = G_1$  faithfully and irreducibly. This is impossible.

We prove Lemma 14.2 first. Let  $t \geq 1$  be such that  $C = G_t$  while  $G_{t+1} = \{1\}$ . Let  $\theta_t$  be the homomorphism of  $G_t$  into  $\mathfrak{P}_K^t / \mathfrak{P}_K^{t+1}$  and  $\theta_0$  the homomorphism of  $G_0/G_1$  into  $U_K^0 / U_K^1$  introduced in Serre's book. If  $\sigma \in G_0$  and  $\gamma \in G_t$  then

$$\theta_t(\sigma \gamma \sigma^{-1} \gamma^{-1}) = (\theta_0^t(\sigma) - 1) \theta_t(\gamma).$$

If  $\sigma$  is not in  $G_1$  then  $\theta_0^t(\sigma)$  is not 1 and  $\gamma \rightarrow \sigma \gamma \sigma^{-1} \gamma^{-1}$  is a one-to-one map of  $C$  onto itself. Thus, if  $\sigma \in G_0$ ,

$$\mu(\sigma \gamma \sigma^{-1}) = \mu(\gamma)$$

implies  $\mu = 1$  or  $\sigma \in G_1$ . Consequently if  $\mu \neq 1$ ,  $G_\mu \cap G_0 = G_1$  and  $L/F_\mu$  is unramified. Since  $\mu = \mu'_{L/F_\mu}$ ,

$$m(\mu') = m(\mu) = t + 1.$$

Observe also that  $t$  must be relatively prime to  $[G_0 : G_1]$ . In particular if  $t$  is even  $[G_0 : G_1]$  is odd.

The relations

$$\begin{aligned}\delta_{K/L} &= ([G_t : 1] - 1)(t + 1) \\ \delta_{L/F} &= [G_0 : G_1] - 1 \\ \delta_{K/E} &= [G_0 : G_1] - 1\end{aligned}$$

and

$$\delta_{K/F} = \delta_{K/L} + [G_1 : 1] \delta_{L/F} = \delta_{K/E} + [G_0 : G_1] \delta_{E/F}$$

obtained from Proposition 4 of Chapter IV of Serre's book, imply that

$$\delta_{E/F} = ([G_1 : 1] - 1) \left( \frac{t}{[G_0 : G_1]} + 1 \right).$$

If  $n = n(\psi_F)$  then

$$n(\psi_{F_\mu/F}) = [G_0 : G_1]n + [G_0 : G_1] - 1$$

and

$$n' = n(\psi_{E/F}) = [G_1 : 1]n + ([G_1 : 1] - 1) \left( \frac{t}{[G_0 : G_1]} + 1 \right).$$

Choose a generator  $\varpi_K$  of  $\mathfrak{P}_K$  and a generator  $\varpi_E$  of  $\mathfrak{P}_E$ . Then set  $\varpi_L = N_{K/L}\varpi_K$  and  $\varpi_F = N_{E/F}\varpi_E$ . There is a unit  $\delta$  in  $K$  such that

$$\frac{\varpi_F^{1+n}}{\varpi_E^{1+n'}} = \delta \frac{\varpi_K^t}{\varpi_L^t}.$$

Taking the norm from  $K$  to  $L$  of both sides we see that if  $q = [G_1 : 1]$  and  $k = [G_0 : G_1]$  then

$$\frac{\varpi_L^{t(q-1)}}{\varpi_F^{\frac{t(q-1)}{k}}} = N_{K/L}\delta.$$

Let  $m = m(\chi_F)$ . If  $m - 1$  is equal to  $\frac{t}{[G_0 : G_1]}$  then  $[G_0 : G_1]$  divides  $t$  and  $[G_0 : G_1]$  is 1. Suppose that

$$m < \frac{t}{[G_0 : G_1]} + 1.$$

Then

$$m(\chi_{F_\mu/F}) < \psi_{F_\mu/F} \left( \frac{t}{[G_0 : G_1]} \right) + 1.$$

However  $\psi_{F_\mu/F} = \varphi_{L/F_\mu} \circ \psi_{L/F} = \psi_{L/F}$  so that

$$\psi_{F_\mu/F}(u) = [G_0 : G_1]u$$

if  $u \geq 0$ . Thus  $m(\chi_{F_\mu/F}) < t + 1$  and  $m(\mu' \chi_{F_\mu/F}) = t + 1$ . Moreover, by Lemmas 13.1 and 6.4,  $m' = m(\chi_{E/F}) = m$ . Choose a generator  $\varpi_{F_\mu}$  of  $\mathfrak{P}_{F_\mu}$ . Then

$$N_{F_\mu/F}(\varpi_{F_\mu}^t) = \gamma_\mu \varpi_F^{t \frac{[F_\mu:F]}{k}}$$

where  $\gamma_\mu$  is a unit. The order of  $\varpi_F^{1+n} \varpi_{F_\mu}^t$  in  $F_\mu$  is  $1 + t + n(\psi_{F_\mu/F})$ . Observing that

$$\sum_{\mu} [F_\mu : F] = q - 1$$

we see that

$$\Delta_1(\chi_{E/F}, \psi_{E/F} \varpi_E^{m'+n'}) \prod_{\mu \in T} \Delta_1(\mu', \psi_{F_\mu/F}, \varpi_F^{1+n} \varpi_{F_\mu}^t)$$

is equal to

$$p \left\{ \prod_{\mu} \chi_F(\gamma_\mu) \right\} \{ \Delta_1(\chi_F, \psi_F, \varpi_F^{m+n}) \} \left\{ \prod_{\mu} \Delta_1(\mu' \chi_{F_\mu/F}, \psi_{F_\mu/F}, \varpi_F^{1+n} \varpi_{F_\mu}^t) \right\}.$$

It is now clear that  $\rho = 1$  if  $m = 0$ .

If

$$m \geq \frac{t}{[G_0 : G_1]} + 1$$

so that in particular  $m \geq 2$ , then

$$m' = m(\chi_{E/F}) = [G_1 : 1]m - ([G_1 : 1] - 1) \left( \frac{t}{[G_0 : G_1]} + 1 \right)$$

is also greater than or equal to 2 and

$$m' + n' = [G_1 : 1](m + n).$$

Since  $m' \geq 2$  and  $K/E$  is tamely ramified

$$m(\chi_{K/F}) = \psi_{K/E}(m(\chi_{E/F}) - 1) + 1 = \psi_{K/F}(m - 1) + 1.$$

Since

$$m(\chi_{F_\mu/F}) \leq \psi_{F_\mu/F}(m-1) + 1$$

and

$$\psi_{F_\mu/F}(m-1) + 1 \geq \psi_{F_\mu/F}\left(\frac{t}{k}\right) + 1 = t + 1$$

we have

$$m(\mu' \chi_{F_\mu/F}) \leq \psi_{F_\mu/F}(m-1) + 1.$$

However

$$\chi_{K/F} = (\mu' \chi_{F_\mu/F})_{K/F_\mu}$$

so that

$$\psi_{K/F_\mu}(\psi_{F_\mu/F}(m-1)) + 1 = \psi_{K/F}(m-1) + 1 = m(\chi_{K/F})$$

is at most

$$\psi_{K/F}(m(\mu' \chi_{F_\mu/F}) - 1) + 1.$$

Thus

$$m(\mu' \chi_{F_\mu/F}) = \psi_{F_\mu/F}(m-1) + 1.$$

Consequently

$$m(\mu' \chi_{F_\mu/F}) + n(\psi_{F_\mu/F}) = [G_0 : G_1](m+n).$$

Since the range of each  $\mu'$  lies in the group of  $q$ th roots of unity

$$\Delta_1(\chi_{E/F}, \psi_{E/F}, \varpi_F^{m+n}) \prod_{\mu} \Delta_1(\mu', \psi_{F_\mu/F}, \varpi_F^{n+1} \varpi_{F_\mu}^t)$$

is equal to

$$\sigma \Delta_1(\chi_F, \psi_F, \varpi_F^{m+n}) \prod_{\mu} \Delta_1(\mu' \chi_{F_\mu/F}, \psi_{F_\mu/F}, \varpi_F^{m+n})$$

with  $\sigma \sim_p \rho$ .

The next step in the proof of the lemma is to establish a simple identity. As usual let  $r$  be the integral part of  $\frac{t+1}{2}$  and let  $r + s = t + 1$ . Choose  $\beta(\mu')$  so that

$$\psi_{F_\mu/F}\left(\frac{\beta(\mu')x}{\varpi_F^{1+n}\varpi_{F_\mu}^t}\right) = \mu'(1+x)$$

for  $x$  in  $\mathfrak{P}_{F_\mu}^s$ . There is a unit  $\alpha_\mu$  in  $L$  such that  $\alpha_\mu \varpi_{F_\mu}^t = \varpi_L^t$ . Then

$$\psi_{L/F}\left(\frac{\alpha_\mu \beta(\mu')x}{\varpi_F^{1+n}\varpi_L^t}\right) = \mu(1+x)$$

for  $x$  in  $\mathfrak{P}_L^s$ . We take  $\beta(\mu) = \alpha_\mu \beta(\mu')$ . If  $\sigma \in G$  a possible choice for  $\beta(\mu^\sigma)$  is

$$\beta(\mu)^\sigma \frac{\varpi_L^t}{\varpi_L^{\sigma t}}.$$

Let  $\phi = O_F/\mathfrak{P}_F = O_E/\mathfrak{P}_E$  and let  $\psi_\phi$  be the additive character of  $\phi$  defined by

$$\psi_\phi(x) = \psi_F\left(\frac{x}{\varpi_F^{1+n}}\right).$$

There is a unique  $\alpha$  in  $\phi$  such that

$$\psi_\phi(\alpha x) = \psi_\phi(x^q).$$

Finally let

$$\omega_1 = S_{E/F}\left(\frac{\varpi_F^{1+n}}{\varpi_E^{1+n'}}\right).$$

I want to show that

$$\prod_\mu \gamma_\mu = \frac{\omega_1^q}{\alpha^q} \prod_\mu N_{F_\mu/F} \beta(\mu') \quad (14.3)$$

in  $\phi$ .

Let  $\lambda = O_L/\mathcal{P}_L = O_K/\mathcal{P}_K$ . If

$$\omega = S_{K/L}\left(\frac{\varpi_K^t}{\varpi_L^t}\right)$$

then  $\omega_1 = \delta\omega$  in  $\lambda$ . We need the following lemma.

**Lemma 14.6**

*Suppose  $K'/F'$  is an abelian extension and  $G' = \mathfrak{G}(K'/F')$ . Suppose there is a  $t \geq 1$  such that  $G' = G'_t$  and  $G'_{t+1} = \{1\}$ . Let  $\varpi_{K'}$  be a generator of  $\mathfrak{P}'_{K'}$ , let  $\varpi_{F'} = N_{K'/F'}(\varpi_{K'})$ , and let*

$$\omega = S_{K'/F'}\left(\frac{\varpi_{K'}^t}{\varpi_{F'}^t}\right).$$

*Also let  $q = [K' : F']$ . There are numbers  $a, \dots, f$  in  $O_{F'}$  such that for all  $x$  in  $O_{F'}$*

$$N_{K'/F'}(1 + x\varpi_{K'}^t)$$

is congruent to

$$1 + (x^q + ax^{\frac{q}{p}} + \dots + fx^p + \omega x)\varpi_{F'}^t$$

modulo  $\mathfrak{P}_{F'}^{t+1}$ .

Suppose  $F' \subseteq L' \subseteq K'$  and the lemma is true for  $K'/L'$  and  $L'/F'$ . The lemma for  $K'/F'$  follows from the relations

$$[K' : F'] = [K' : L'] [L' : F']$$

and

$$N_{K'/F'}(1 + x\varpi_{K'}^t) = N_{L'/F'}(N_{K'/L'}(1 + x\varpi_{K'}^t))$$

and

$$S_{K'/F'}\left(\frac{\varpi_{K'}^t}{\varpi_{F'}^t}\right) \equiv S_{L'/F'}\left(\frac{\varpi_{L'}^t}{\varpi_{F'}^t}\right) S_{K'/L'}\left(\frac{\varpi_{K'}^t}{\varpi_{L'}^t}\right).$$

The lemma for extensions of prime order is proved in Serre's book.

Suppose then

$$N_{K/L}(1 + x\varpi_K^t) \equiv 1 + (x^q + \dots + \varpi x)\varpi_L^t \pmod{\mathfrak{P}_L^{t+1}}$$

for  $x$  in  $O_L$ . Since

$$\psi_{\lambda/\phi}(\alpha x) = \psi_{\phi}(\alpha S_{\lambda/\phi}(x)) = \psi_{\phi}((S_{\lambda/\phi}(x))^q)$$

which in turn equals

$$\psi_{\phi}(S_{\lambda/\phi}x^q) = \psi_{\lambda/\phi}(x^q)$$

we conclude that

$$\psi_{\lambda/\phi}(y(x^q + \dots + \omega x)) = \psi_{\lambda/\phi}((\alpha y^{\frac{1}{q}} + \dots + \omega y)x).$$

Also

$$\left(\alpha y^{\frac{1}{q}} + \dots + \omega y\right)^q = \alpha^q y + \dots + \omega^q y^q$$

is a polynomial  $Q(y)$  in  $y$ .

For each  $\nu$  in  $S(K/L)$ , we choose  $\beta_1(\nu)$  so that

$$\psi_{L/F}\left(\frac{\beta_1(\nu)x}{\varpi_F^{1+n}\varpi_L^t}\right) = \nu(1+x)$$

for  $x$  in  $\mathcal{P}_L^s$ . Since  $k^p = k$  in  $\lambda$

$$\psi_{\lambda/\phi}(k\beta_1(\nu)(x^q + \dots + \omega x)) = \psi_{\lambda/\phi}(\beta_1(\nu)[(kx)^q + \dots + \omega kx])$$

if  $x$  is in  $O_F$ . The left side is also equal to

$$\psi_{L/F} \left( \frac{\beta_1(\nu) P_{K/L}(x \varpi_K^t)}{\varpi_F^{1+n} \varpi_L^t} \right) = 1.$$

Thus  $Q(k\beta_1(\nu)) = 0$ . Since  $\beta_1(\nu_1) = \beta_2(\nu_2) \pmod{\mathfrak{P}_L}$  implies  $\nu_1 = \nu_2$  we have found all the roots of  $Q(y) = 0$ . Thus

$$\frac{\alpha^q}{\omega^q} \equiv \prod_{\nu \neq 1} k\beta_1(\nu) \equiv \prod_{\nu \neq 1} \beta_1(\nu) \pmod{\mathfrak{P}_L}.$$

Let  $M_\mu$  be a set of representatives for the cosets of  $G_\mu$  in  $G$ . Then

$$\prod_{\mu \in T} N_{F_\mu/F} \beta(\mu') = \prod_{\mu \in T} \prod_{\sigma \in M_\mu} \beta(\mu')^\sigma$$

is congruent to

$$\left\{ \prod_{\nu \neq 1} \beta_1(\nu) \right\} \left\{ \prod_{\mu \in T} \prod_{\sigma \in M_\mu} \alpha_\mu^\sigma \frac{\varpi_L^t}{\varpi_L^{\sigma t}} \right\}^{-1}$$

modulo  $\mathfrak{P}_L$ . To verify the identity (14.3) we have to show that

$$\left\{ \prod_{\mu} \prod_{\sigma \in M_\mu} \alpha_\mu^\sigma \frac{\varpi_L^t}{\varpi_L^{\sigma t}} \right\} \left\{ \prod_{\mu} \gamma_\mu \right\} \equiv \delta^q \pmod{\mathfrak{P}_K}.$$

Since

$$\gamma_\mu = \left\{ \prod_{\sigma \in M_\mu} \frac{\varpi_L^{\sigma t}}{\alpha_\mu^\sigma} \right\} \varpi_F^{-t \frac{[F_\mu:F]}{k}}$$

the congruence reduces to

$$\frac{\varpi_L^{t(q-1)}}{\varpi_F^{\frac{t(q-1)}{k}}} \equiv \delta^q \pmod{\mathfrak{P}_K}$$

which is valid because the left side is  $N_{K/L} \delta$  and

$$N_{K/L} \delta \equiv \delta^q \pmod{\mathfrak{P}_K}.$$

If  $m = 1$  then  $m(\chi_{F_\mu/F}) \leq 1$  and we can take  $\beta(\mu' \chi_{F_\mu/F}) = \beta(\mu')$ . Then

$$\Delta_2(\mu', \psi_{F_\mu/F}, \varpi_F^{1+n} \varpi_{F_\mu}^t)$$

is equal to

$$\chi_F(N_{F_\mu/F}(\beta(\mu'))) \Delta_2(\mu' \chi_{F_\mu/F}, \psi_{F_\mu/F}, \varpi_F^{1+n} \varpi_{F_\mu}^t).$$

Lemma 9.4 implies that

$$\Delta_3(\mu', \psi_{F_\mu/F}, \varpi_F^{1+n} \varpi_{F_\mu}^t) = \Delta_3(\mu' \chi_{F_\mu/F}, \psi_{F_\mu/F}, \varpi_F^{1+n} \varpi_{F_\mu}^t).$$

If  $x$  belongs to  $O_E$  then

$$\psi_{E/F} \left( \frac{x}{\varpi_E^{1+n'}} \right) = \psi_\phi(\omega_1 x).$$

If  $\chi_\phi$  is the character of  $\phi^*$  determined by  $\chi_F$  then

$$\Delta_1(\chi_F, \psi_F, \varpi_F^{1+n}) = A[-\tau(\chi_\phi, \psi_\phi)]$$

and

$$\Delta_1(\chi_{E/F}, \psi_{E/F}, \varpi_E^{1+n'}) = \chi_\phi(\omega_1^q) A[-\tau(\chi_\phi^q, \psi_\phi)].$$

The right side of this expression is equal to

$$\chi_\phi(\omega_1^q \alpha^{-q}) A[-\tau(\chi_\phi, \psi_\phi)].$$

The identity (14.3) now shows that  $\rho = 1$  when  $m = 1$ .

Suppose that

$$1 < m < \frac{t}{[G_0 : G_1]} + 1.$$

Let  $\beta$  be a given choice of  $\beta(\chi_F)$ . Then

$$\beta(\chi_{E/F}) \equiv P_{E/F}^*(\beta, \varpi_E^{m'+n'}, \varpi_F^{m+n}) \pmod{\mathfrak{P}_E^{d'}}$$

if  $m' = 2d' + \varepsilon'$ . On the other hand

$$\psi_{L/F}(m-1) + 1 + n(\psi_{L/F}) = [G_0 : G_1](m-1) + 1 + [G : G_0]n + [G_0 : G_1] - 1$$

which equals  $[G_0 : G_1](m+n)$  and Lemmas 8.3, 8.4 and 8.7 imply that

$$P_{L/F}^*(\beta, \varpi_F^{m+n}, \varpi_F^{m+n}) \equiv \beta \pmod{\mathfrak{P}_L^{d_1}}$$

if

$$\psi_{L/F}(m-1) + 1 = 2d_1 + \varepsilon_1.$$

If

$$\psi_{K/F}(m-1) + 1 = 2d'_1 + \varepsilon'_1$$

then

$$P_{K/E}^*(\beta(\chi_{E/F}, \varpi_E^{m'+n'}, \varpi_E^{m'+n'}) \equiv \beta(\chi_{E/F}) \pmod{\mathfrak{P}_K^{d'_1}}.$$

Thus

$$\beta(\chi_{E/F}) \equiv P_{K/F}^*(\beta, \varpi_E^{m'+n'}, \varpi_F^{m+n}) \pmod{\mathfrak{P}_K^{d'_1}}.$$

Let

$$v = t + 1 - (\psi_{L/F}(m-1) + 1) = t - [G_0 : G_1](m-1).$$

If

$$\gamma = \frac{\varpi_L^{t-v}}{\varpi_F^{m-1}}$$

and

$$\gamma' = \frac{\varpi_E^{m'+n'} \varpi_K^v}{\varpi_F^{1+n} \varpi_L^t}$$

then

$$P_{K/F}^*(\beta, \varpi_E^{m'+n'}, \varpi_F^{m+n}) \equiv P_{K/L}^*(\beta, \varpi_E^{m'+n'}, \varpi_F^{m+n}) \pmod{\mathfrak{P}_K^{d'_1}}$$

is congruent to

$$\gamma' P_{K/L}^*(\gamma \beta, \varpi_F^{1+n} \varpi_L^t \varpi_K^{-v}, \varpi_F^{1+n} \varpi_L^{t-v})$$

modulo  $\mathfrak{P}_K^{d'_1}$ .

It is clear that

$$\Delta_2(\chi_{E/F}, \psi_{E/F}, \varpi_E^{m'+n'}) \sim_p \chi_F^{-1}(N_{E/F}(\beta(\chi_{E/F})))$$

and that

$$\Delta_2(\mu', \psi_{F_\mu/F}, \varpi_F^{n+1} \varpi_{F_\mu}^t) \sim_p 1.$$

If we choose

$$\beta(\mu' \chi_{F_\mu/F}) = \beta(\mu') + \beta \frac{\varpi_{F_\mu}^t}{\varpi_F^{m-1}}$$

then

$$\Delta_2(\mu' \chi_{F_\mu/F}, \psi_{F_\mu/F}, \varpi_F^{n+1} \varpi_{F_\mu}^t) \sim_p \chi_F^{-1} \left( N_{F_\mu/F} \left( \beta(\mu') + \beta \frac{\varpi_{F_\mu}^t}{\varpi_F^{m-1}} \right) \right).$$

Moreover

$$\Delta_2(\chi_F, \psi_F, \varpi_F^{m+n}) \sim_p \chi_F^{-1}(\beta).$$

Let

$$\Delta_2(\chi_{E/F}, \psi_{E/F}, \varpi_E^{m'+n'}) \prod_{\mu} \Delta_2(\mu', \psi_{F_{\mu}/F}, \varpi_F^{n+1} \varpi_{F_{\mu}}^t)$$

equal

$$\tau \Delta_2(\chi_F, \psi_F, \varpi_F^{m+n}) \left\{ \prod_{\mu} \Delta_2(\mu' \chi_{F_{\mu}/F}, \psi_{F_{\mu}/F}, \varpi_F^{n+1} \varpi_{F_{\mu}}^t) \right\} \left\{ \prod_{\mu} \chi_F(\gamma_{\mu}) \right\}.$$

Since

$$\chi_F(u) \sim_p 1$$

if  $u \in U_F^1$ , all we need do to show that  $\tau \sim_p 1$  is prove that

$$\beta \prod_{\mu} N_{F_{\mu}/F} \left( \beta(\mu') + \beta \frac{\varpi_{F_{\mu}}^t}{\varpi_F^{m-1}} \right)$$

is congruent to

$$N_{E/F}(\beta(\chi_{E/F})) \prod_{\mu} \gamma_{\mu}$$

modulo  $\mathfrak{P}_F$ .

As before we choose  $\beta(\mu) = \alpha_{\mu}(\beta(\mu'))$ . If  $\nu = \mu^{\sigma}$  a possible choice for  $\beta(\nu)$  is

$$\alpha_{\mu}^{\sigma} \beta(\mu')^{\sigma} \frac{\varpi_L^t}{\varpi_L^{\sigma t}}.$$

We can also choose

$$\beta(\mu \chi_{L/F}) = \alpha_{\mu} \beta(\mu') + \beta \frac{\varpi_L^t}{\varpi_F^{m-1}} = \alpha_{\mu} \left( \beta(\mu') + \beta \frac{\varpi_{F_{\mu}}^t}{\varpi_F^{m-1}} \right).$$

Then a possible choice for  $B(\mu^{\sigma} \chi_{L/F})$  is

$$\alpha_{\mu}^{\sigma} \left\{ \beta(\mu') + \beta \frac{\varpi_{F_{\mu}}^t}{\varpi_F^{m-1}} \right\}^{\sigma} \frac{\varpi_L^t}{\varpi_L^{\sigma t}} = \alpha_{\mu}^{\sigma} (\beta(\mu')^{\sigma}) \frac{\varpi_L^t}{\varpi_L^{\sigma t}} + \beta \frac{\varpi_L^t}{\varpi_F^{m-1}}.$$

We apply Lemma 8.10 with  $F$  replace by  $L$ ,

$$\delta = \varpi_F^{1+n} \varpi_L^t$$

and  $\varepsilon_1 = \varpi_K^v$ . It implies that

$$N_{K/L} \left( \frac{\beta(\chi_{E/F})}{\gamma'} \right)$$

is congruent to

$$\gamma_\beta \prod_{\mu \in T} \prod_{\sigma \in M_\mu} \left\{ \alpha_\mu^\sigma \left( \beta(\mu') + \beta \frac{\varpi_{F_\mu}^t}{\varpi_F^{m-1}} \right)^\sigma \frac{\varpi_L^t}{\varpi_L^{\sigma t}} \right\}$$

modulo  $\mathfrak{P}_L$ . The last expression is equal to

$$\gamma_\beta \left\{ \prod_{\mu \in T} N_{F_\mu/F} \left( \beta(\mu') + \beta \frac{\varpi_{F_\mu}^t}{\varpi_F^t} \right) \right\} \left\{ \prod_{\mu \in T} \prod_{\sigma \in M_\mu} \alpha_\mu^\sigma \frac{\varpi_L^t}{\varpi_L^{\sigma t}} \right\}$$

and we have to show that

$$\gamma^{N_{K/L}(\gamma')} \left\{ \prod_{\mu} \gamma_\mu \right\} \left\{ \prod_{\mu \in T} \prod_{\sigma \in M_\mu} \alpha_\mu^\sigma \frac{\varpi_L^t}{\varpi_L^{\sigma t}} \right\}$$

is congruent to 1 modulo  $\mathfrak{P}_L$ . First of all

$$N_{K/L}(\gamma') = \varpi_F^{m'+n'-q(1+n)} \varpi_L^{-qt+v} = \gamma^{-1} \frac{\varpi_F^{\frac{(q-1)t}{k}}}{\varpi_L^{(q-1)t}}.$$

Since

$$\gamma_\mu = \left\{ \prod_{\sigma \in M_\mu} \frac{\alpha_\mu^\sigma}{\varpi_L^{\sigma t}} \right\}^{-1} \varpi_F^{-t \frac{[F_\mu:F]}{k}}$$

the required relation follows.

Define  $\eta$  by setting

$$\eta \Delta_3 \left( \chi_{E/F}, \psi_{E/F}, \varpi_E^{m'+n'} \right) \prod_{\mu \in T} \Delta_3 \left( \mu', \psi_{F_\mu/F}, \varpi_F^{1+n} \varpi_{F_\mu}^t \right)$$

equal to

$$\Delta_3(\chi_F, \psi_F, \varpi_F^{m+n}) \prod_{\mu \in T} \Delta_3 \left( \mu' \chi_{F_\mu/F}, \psi_{F_\mu/F}, \varpi_F^{1+n} \varpi_{F_\mu}^t \right).$$

We now know that  $\eta \sim_p \rho$ . We shall show that  $\eta \sim_p 1$ . This will prove not only the assertion of Lemma 14.2 but also that of Lemma 14.3, provided of course that

$$m-1 < \frac{t}{[G_0 : G_1]}.$$

Lemmas 9.2 and 9.3 imply directly that  $\eta \sim_p 1$  if  $p$  is 2.

Suppose  $p$  is odd. Lemma 9.4 implies that

$$\Delta_3(\mu', \psi_{F_\mu/F}, \varpi_F^{1+n} \varpi_{F_\mu}^t) \sim_p \Delta_3(\mu' \chi_{F_\mu/F}, \psi_{F_\mu/F}, \varpi_F^{1+n} \varpi_{F_\mu}^t).$$

Since  $m' = m$  all we need do is show that

$$\Delta_3(\chi_{E/F}, \psi_{E/F}, \varpi_E^{m'+n'}) \sim_p \Delta_3(\chi_F, \psi_F, \varpi_F^{m+n})$$

when  $m$  is odd. Let  $\phi = O_F/\mathfrak{P}_F = O_E/\mathfrak{P}_E$ . Let  $\beta' = \beta(\chi_{E/F})$  and let  $\beta = \beta(\chi_F)$ . If  $\psi'_\phi$  is the character of  $\phi$  defined by

$$\psi'_\phi(x) = \psi_F\left(\frac{\beta x}{\varpi_F^{n+1}}\right)$$

and  $\psi''_\phi$  is the character of  $\phi$  defined by

$$\psi''_\phi(x) = \psi_{E/F}\left(\frac{\beta' x}{\varpi_E^{n'+1}}\right)$$

and if  $\psi''_\phi(x) = \psi'_\phi(\delta x)$  then, by Lemmas 9.2 and 9.3, all we have to do is show that  $\delta$  is a square in  $\phi$ . If

$$\omega_1 = S_{E/F}\left(\frac{\varpi_F^{n+1}}{\varpi_E^{n'+1}}\right)$$

then  $\delta = \omega_1 \frac{\beta'}{\beta}$  in  $\phi$ . To show that  $\delta$  is a square we show that  $\delta^q$  is a square.

$$\delta^q \equiv N_{E/F} \alpha \equiv \beta^{1-q} \frac{N_{E/F}(\beta')}{\beta} \omega_1^q.$$

We saw that

$$\frac{N_{E/F}(\beta')}{\beta} = \left\{ \prod_\mu \gamma_\mu \right\}^{-1} \left\{ \prod_\mu N_{F_\mu/F} \left( \beta(\mu') + \beta \frac{\varpi_{F_\mu}^t}{\varpi_F^{m-1}} \right) \right\}$$

in  $\phi$ . But

$$\beta \frac{\varpi_{F_\mu}^t}{\varpi_F^{m-1}} \equiv 0 \pmod{\mathfrak{P}_L}$$

because  $t > [G_0 : G_1](m - 1)$ . We also saw that

$$\left\{ \prod_{\mu} \gamma_{\mu} \right\}^{-1} \left\{ \prod_{\mu} N_{F_{\mu}/F} \beta(\mu') \right\} = \frac{\alpha^q}{\varpi_1^q}$$

in  $\phi$ . Since  $\beta^{1-q}$  is clearly a square, we need only check that  $\alpha$  is a square. The character

$$x \longrightarrow \psi_{\phi}(x^q - \alpha x)$$

is identically 1, so that the kernel of the map

$$x \longrightarrow x^q - \alpha x$$

is non-trivial. Thus  $\alpha = x^{q-1}$  for some  $x$  in  $\phi$ .

Now suppose that

$$m - 1 \geq \frac{t}{[G_0 : G_1]}.$$

We have to show that the complex number  $\sigma$  defined at the beginning of the proof satisfies  $\sigma \sim_{2p} 1$ . To prove Lemma 14.3 we will have to show that  $\sigma \sim_p 1$  if  $[G : G_1]$  is a power of 2.

Given  $\beta = \beta(\chi_F)$  we may choose  $\beta(\chi_{L/F}) = \beta(\chi_{F_{\mu}/F}) = \beta$ . Moreover

$$\beta(\chi_{E/F}) \equiv P_{E/F}^*(\beta, \varpi_F^{m+n}, \varpi_F^{m+n}) \pmod{\mathfrak{P}_E^{d'}}$$

if  $m' = m(\chi_{E/F}) = 2d' + \varepsilon'$ . By Lemmas 8.3, 8.4 and 8.7

$$P_{K/F}^*(\beta, \varpi_F^{m+n}, \varpi_F^{m+n}) \equiv P_{K/E}^*(\beta(\chi_{E/F}), \varpi_F^{m+n}, \varpi_F^{m+n}) \equiv \beta(\chi_{E/F})$$

modulo  $\mathcal{P}_K^{d'_1}$  if

$$\psi_{K/F}(m - 1) + 1 = 2d'_1 + \varepsilon'_1.$$

Thus

$$\beta(\chi_{E/F}) \equiv P_{K/L}^*(\beta, \varpi_F^{m+n}, \varpi_F^{m+n}) \pmod{\mathfrak{P}_K^{d'_1}}.$$

If

$$\psi_{F_{\mu}/F}(m - 1) + 1 = 2d_{\mu} + \varepsilon_{\mu}$$

and

$$\psi_{F_{\mu}/F} \left( \frac{\alpha(\mu')x}{\varpi_F^{m+n}} \right) = \mu'(1 + x)$$

for  $x$  in  $\mathfrak{P}_{F_\mu}^{d_\mu + \varepsilon_\mu}$  we may take

$$\beta(\mu' \chi_{F_\mu/F}) = \beta + \alpha(\mu').$$

If

$$\psi_{L/F}(m-1) + 1 = 2d_1 + \varepsilon_1$$

then

$$\mu(1+x) = \psi_{L/F} \left( \frac{\alpha(\mu')x}{\varpi_F^{m+n}} \right)$$

for  $x$  in  $\mathfrak{P}_L^{d_1 + \varepsilon_1}$ . If  $\nu = \mu^\sigma$  then

$$\nu(1+x) = \psi_{L/F} \left( \frac{\alpha(\mu')^\sigma x}{\varpi_F^{m+n}} \right)$$

for  $x$  in  $\mathfrak{P}_L^{d_1 + \varepsilon_1}$ . Lemma 8.2 implies that

$$N_{E/F}(\beta(\chi_{E/F})) = N_{K/L}(\beta(\chi_{E/F}))$$

is congruent to

$$\beta \prod_{\mu \in T} \prod_{\sigma \in M_\mu} (\beta + \alpha(\mu')^\sigma)$$

modulo  $\mathfrak{P}_L$ . The last expression is equal to

$$\beta \prod_{\mu \in T} N_{F_\mu/F}(\beta + \alpha(\mu')).$$

Moreover

$$\Delta_2(\chi_F, \psi_F, \varpi_F^{m+n}) \sim_p \chi_F^{-1}(\beta)$$

$$\Delta_2(\mu', \psi_{F_\mu/F}, \varpi_F^{1+n} \varpi_{F_\mu}^t) \sim_p 1$$

$$\Delta_2(\chi_{E/F}, \psi_{E/F}, \varpi_F^{m+n}) \sim_p \chi_F^{-1}(N_{E/F}(\beta(\chi_{E/F})))$$

$$\Delta_2(\mu' \chi_{F_\mu/F}, \psi_{F_\mu/F}, \varpi_F^{m+n}) \sim_p \chi_F^{-1}(N_{F_\mu/F}(\beta + \alpha(\mu'))).$$

Define  $\tau$  by demanding that

$$\Delta_3(\chi_{E/F}, \psi_{E/F}, \varpi_F^{m+n}) \prod_{\mu} \Delta_3(\mu', \psi_{F_\mu/F}, \varpi_F^{1+n} \varpi_{F_\mu}^t)$$

be equal to

$$\tau \Delta_3(\chi_F, \psi_F, \varpi_F^{m+n}) \prod_{\mu} \Delta_3(\mu', \chi_{F_\mu/F}, \psi_{F_\mu/F}, \varpi_F^{m+n}).$$

Since  $\chi_F(u) \sim_p 1$  if  $u \in U_F^1$  the preceding discussion shows that  $\sigma \sim_p \tau$ . Lemmas 9.2 and 9.3 show that  $\tau \sim_{2p} 1$ . Lemma 14.2 is now completely proved. To prove Lemma 14.3 we have to show that  $\tau \sim_p 1$  if  $[G : G_1]$  is a power of 2. We may suppose that  $p$  is odd.

There are a number of possibilities.

(i.a)  $t$  is even and  $m$  is odd.  $[G_0 : G_1]$  must be odd and hence 1, for we are now assuming that  $[G : G_1]$  is a power of 2. Since

$$m(\chi_{F_\mu/F}) = [G_0 : G_1](m-1) + 1$$

and

$$m(\chi_{E/F}) = [G_1 : 1](m-1) - \frac{([G_1 : 1] - 1)t}{[G_0 : G_1]} + 1$$

both  $m(\chi_{F_\mu/F})$  and  $m(\chi_{E/F})$  are odd.

(i.b)  $t$  is even and  $m$  is even. Again  $[G_0 : G_1]$  is 1. This time both  $m(\chi_{F_\mu/F})$  and  $m(\chi_{E/F})$  are even.

(ii.a)  $t$  is odd and  $m$  is odd. Then  $m(\chi_{F_\mu/F})$  is odd. If

$$\frac{[G_1 : 1] - 1}{[G_0 : G_1]}$$

is even  $m(\chi_{E/F})$  is odd. Otherwise it is even.

(ii.b)  $t$  is odd and  $m$  is even. If  $[G_0 : G_1]$  is odd, that is 1, then  $m(\chi_{F_\mu/F})$  is odd and  $m(\chi_{E/F})$  is even. If  $[G_0 : G_1]$  is even then  $m(\chi_{F_\mu/F})$  is odd and  $m(\chi_{E/F})$  is even or odd according as

$$\frac{[G_1 : 1] - 1}{[G_0 : G_1]}$$

is even or odd.

If  $t$  is odd then clearly

$$\prod_{\mu} \Delta_3(\mu', \psi_{F_\mu/F}, \varpi_F^{1+n} \varpi_{F_\mu}^t) \sim_p 1.$$

We are going to show that this is also true if  $t$  is even. Then  $L/F$ , and hence  $F_\mu/F$ , is unramified. Let  $\phi_\mu = O_{F_\mu}/\mathfrak{P}_{F_\mu}$ . If

$$\psi_{\phi_\mu}(x) = \psi_{F_\mu/F} \left( \frac{\beta(\mu')x}{\varpi_F^{1+n}} \right)$$

and if  $\varphi_{\phi_\mu}$  is a nowhere vanishing function on  $\phi_\mu$  satisfying

$$\varphi_{\phi_\mu}(x+y) = \varphi_{\phi_\mu}(x) \varphi_{\phi_\mu}(y) \psi_{\phi_\mu}(xy)$$

then

$$\Delta_3(\mu', \psi_{F_\mu/F}, \varpi_F^{1+n} \varpi_{F_\mu}^t) \sim_p A[-\sigma(\varphi_{\phi_\mu})].$$

If  $\alpha$  belongs to  $\phi_\mu^*$  let  $\nu_{\phi_\mu}(\alpha)$  equal +1 or -1 according as  $\alpha$  is or is not a square in  $\phi_\mu$ . If  $\phi = O_F/\mathfrak{P}_F$  then

$$\nu_{\phi_\mu}(\alpha) = \nu_\phi(N_{\phi_\mu/\phi}(\alpha)).$$

If

$$\psi_\phi(x) = \psi_F\left(\frac{x}{\varpi_F^{1+n}}\right)$$

then, according to paragraph 9,

$$\Delta_3(\mu', \psi_{F_\mu/F}, \varpi_F^{1+n} \varpi_{F_\mu}^t) \sim_p \nu_\phi(N_{F_\mu/F}(\beta(\mu'))) \{A[-\sigma(\varphi_\phi)]\}^{[F_\mu:F]}$$

if  $\varphi_\phi$  is any nowhere vanishing function on  $\phi$  satisfying

$$\varphi_\phi(x+y) = \varphi_\phi(x) \varphi_\phi(y) \psi_\phi(xy).$$

Thus if  $a$  is the number of  $\mu$  in  $T$

$$\prod_{\mu} \Delta_3(\mu', \psi_{F_\mu/F}, \varpi_F^{1+n} \varpi_{F_\mu}^t)$$

is equal to

$$\eta(-1)^a \nu_\phi\left(\prod_{\mu} N_{F_\mu/F}(\beta(\mu'))\right) A[\sigma(\varphi_\phi)^{q-1}]$$

where  $\eta \sim_p 1$  and  $q = [G_1 : 1]$ .

We saw in paragraph 9 that

$$A[\sigma(\varphi_\phi)^2] \sim_p \nu_\phi(-1) A[|\sigma(\varphi_\phi)|^2] = \nu_\phi(-1).$$

Since  $t$  is even  $G_0 = G_1$  and  $G/G_1 = G/G_0$  is abelian. If  $\sigma \in G$

$$\{\mu \in S(K/L) \mid \mu = \mu^\sigma\}$$

is a subgroup of  $S(K/L)$  invariant under  $G$ . It is necessarily either  $S(K/L)$  or  $\{1\}$ . If  $\sigma$  is not in  $G_1$  it is not  $S(K/L)$ . Thus  $G_\mu$ , the isotropy group of  $\mu$ , is  $G_1$  for all  $\mu$  in  $T$  and  $F_\mu = L$ . Moreover

$$\prod_{\mu} N_{F_\mu/F}(\beta(\mu')) = \prod_{\mu} \prod_{\sigma \in G/G_1} \beta(\mu')^\sigma.$$

We may regard  $C = G_1$  as a vector space over the field with  $p$  elements. If  $\sigma \in G/G_1$  and the order of  $\sigma$  divides  $p - 1$  then all the eigenvalues of the linear transformation  $c \rightarrow \sigma c \sigma^{-1}$  lie in the prime field. Since the linear transformation also has order dividing  $p - 1$  it is diagonalizable. Since  $G/G_1$  is abelian and acts irreducibly on  $C$  the linear transformation is a multiple of the identity. In particular if  $\sigma_0$  is the unique element of order 2 then  $\sigma_0 c \sigma_0^{-1} = c^{-1}$  for all  $c$ . As a consequence  $\mu^{\sigma_0} = \mu^{-1}$  and

$$\beta(\mu')^{\sigma_0} \equiv -\beta(\mu') \pmod{\mathfrak{P}_L}$$

if we choose, as we may since  $F_\mu/F$  is unramified,  $\varpi_{F_\mu} = \varpi_F$ . If  $D$  is the group  $\{1, \sigma_0\}$  and  $M$  is a set of representatives for the cosets of  $D$  in  $G/G_1$  then

$$\prod_{\mu \in T} \prod_{\sigma \in G/G_1} \beta(\mu')^\sigma = \gamma \gamma^{\sigma_0}$$

if

$$\gamma = \prod_{\mu \in T} \prod_{\sigma \in M} \beta(\mu')^\sigma.$$

Clearly

$$\gamma \gamma^{\sigma_0} = (1 - \gamma^2)^{\frac{q-1}{2}} \pmod{\mathfrak{P}_L}.$$

If  $\chi$  is the non-trivial character of  $D$  and

$$v : G/G_0 \longrightarrow D$$

is the transfer then

$$\gamma^\sigma = \chi(v(\sigma))^a \gamma$$

for all  $\sigma$  in  $G/G_0$ .  $\nu_\phi(\gamma^2) = 1$  if and only if  $\chi(v(\sigma))^a$  is 1 for all  $\sigma$ . If  $\sigma$  is a generator of  $G/G_0$  then

$$v(\sigma) = \sigma^{\frac{[G:G_0]}{2}} = \sigma_0$$

so that  $\nu_\phi(\gamma^2) = (-1)^a$ . Putting all these facts together we see that

$$\prod_{\mu} \Delta_3(\mu', \psi_{F_\mu/F}, \varpi_F^{1+n} \varpi_{F_\mu}^t) \sim_p 1.$$

Observe that if we had taken  $\varpi_{F_\mu}$  to be  $\delta_\mu \varpi_F$  then  $N_{F_\mu/F} \beta(\mu')$  would have to be multiplied by

$$\{N_{F_\mu/F} \delta_\mu\}^t$$

which is a square modulo  $\mathfrak{P}_F$  because  $t$  is even. Thus the result is valid for all choices of  $\varpi_{F_\mu}$ .

Eventually we will have to discuss the various possibilities separately. There are however a number of comments we should make first. If  $m$  is odd and  $m(\chi_{F_\mu/F})$  is odd then

$$\Delta_3(\mu' \chi_{F_\mu/F}, \psi_{F_\mu/F}, \varpi_F^{m+n}) \sim_p \nu_{\phi_\mu}(\beta + \alpha(\mu')) A[-\sigma(\varphi_{\phi_\mu})]$$

if

$$\psi_{\phi_\mu}(x) = \psi_{F_\mu/F} \left( \frac{x}{\varpi_F^{1+n}} \right).$$

Observe that, because  $m$  is odd, we may take the number  $\delta$  in Lemma 9.3 to be  $\varpi_F^{\frac{m-1}{2}}$ . Of course  $\varphi_{\phi_\mu}$  is any function on  $\phi_\mu$  which vanishes nowhere and satisfies

$$\varphi_{\phi_\mu}(x+y) = \varphi_{\phi_\mu}(x) \varphi_{\phi_\mu}(y) \psi_{\phi_\mu}(xy).$$

Applying Lemma 9.1 we see that

$$A[-\sigma(\varphi_{\phi_\mu})] \sim_p -\nu_\phi \left( k^{\frac{[F_\mu:F]}{k}} \right) A[\sigma(\varphi_\phi)^{\frac{[F_\mu:F]}{k}}]$$

if  $k = [G_0 : G_1]$ , if

$$\psi_\phi(x) = \psi_F \left( \frac{x}{\varpi_F^{1+n}} \right)$$

and if  $\varphi_\phi$  bears the usual relation to  $\psi_\phi$ . We use, of course, the relation

$$k S_{\phi_\mu/\phi}(x) = S_{F_\mu/F}(x).$$

Observe also that

$$\nu_{\phi_\mu}(\beta + \alpha(\mu')) = \nu_\phi(N_{\phi_\mu/\phi}(\beta + \alpha(\mu'))).$$

If  $m$  is odd

$$\Delta_3(\chi_F, \psi_F, \varpi_F^{m+n}) \sim_p -\nu_\phi(\beta) A[\sigma(\varphi_\phi)].$$

If both  $m$  and  $m' = m(\chi_{E/F})$  are odd and if  $\beta' = \beta(\chi_{E/F})$  then

$$\Delta_3(\chi_{E/F}, \psi_{E/F}, \varpi_F^{m+n}) \sim_p -\nu_\phi(\beta') A[\sigma(\varphi'_\phi)]$$

if  $\varphi'_\phi$  bears the usual relation to the character

$$\psi'_\phi(x) = \psi_{E/F} \left( \frac{x}{\varpi_F^{1+n} \varpi_E^{\frac{(q-1)t}{k}}} \right).$$

There is a unit  $\varepsilon$  in  $O_K$  such that  $\varpi_E = \varepsilon \varpi_K^q$ . If  $\sigma \in C$  then

$$\varpi_E^{\sigma-1} = \varepsilon^{\sigma-1} \varpi_K^{(\sigma-1)q} \equiv 1 \pmod{\mathfrak{P}_K}$$

because  $t \geq 1$ . Thus the multiplicative congruence

$$\varpi_E^q \equiv N_{E/F} \varpi_E = \varpi_F \pmod{* \mathfrak{P}_E}$$

is satisfied and

$$\frac{1}{\varpi_E^{\frac{(q-1)t}{k}}} \equiv \frac{\varpi_F^{1+n}}{\varpi_E^{1+n'}} \pmod{* \mathfrak{P}_E}.$$

If

$$\omega_1 = S \left( \frac{\varpi_F^{1+n}}{\varpi_E^{1+n'}} \right)$$

as before, then

$$\psi'_\phi(x) = \psi_F \left( \frac{\omega_1 x}{\varpi_F^{1+n}} \right).$$

Since

$$\nu_\phi(\beta') = \nu_\phi(\beta')^q = \nu_\phi(N_{E/F} \beta')$$

we have

$$\Delta_3(\chi_{E/F}, \psi_{E/F}, \varpi_F^{m+n}) \sim_p -\nu_\phi(N_{E/F} \beta') \nu_\phi(\omega_1) A[\sigma(\varphi_\phi)].$$

Define  $\eta$  by demanding that

$$\Delta_3(\chi_{E/F}, \psi_{E/F}, \varpi_F^{m+n})$$

be equal to

$$\eta \Delta_3(\chi_F, \psi_F, \varpi_F^{m+n}) \prod_\mu \Delta_3(\mu' \chi_{F_\mu/F}, \psi_{F_\mu/F}, \varpi_F^{m+n}).$$

We have to show that  $\eta \sim_p 1$ . If both  $t$  and  $m$  are even this is clear. If  $t$  is even and  $m$  is odd we are to show that

$$\nu_\phi(N_{E/F} \beta') \nu_\phi(\omega_1) \sim_p (-1)^a \nu_\phi(-1)^{\frac{q-1}{2k}} \nu_\phi(k)^{\frac{q-1}{k}} \nu_\phi(\beta) \prod_\mu \nu_\phi(N_{\phi_\mu/\phi}(\beta + \alpha(\mu')))$$

if  $a$  is the number of elements in  $T$ . Since  $t$  is even  $k$  is 1. As before

$$\beta \prod_{\mu} N_{\phi_{\mu}/\phi}(\beta + \alpha(\mu')) = \beta \prod_{\mu} \prod_{\sigma \in G/G_1} (\beta + \alpha(\mu')^{\sigma})$$

is congruent to  $N_{E/F}\beta'$  modulo  $\mathfrak{P}_K$ . All we need do is show that

$$\nu_{\phi}(\omega_1) = (-1)^a \nu_{\phi}(-1)^{\frac{q-1}{2}}.$$

Since  $t$  is even each  $\gamma_{\mu}$  is a square in  $\phi$ . Applying the identity (14.3) we see that

$$\nu_{\phi}(\omega_1) = \nu_{\phi}(\omega_1^q) = \nu_{\phi}(\alpha) \nu_{\phi}^{-1} \left( \prod_{\mu} N_{F_{\mu}/F} \beta(\mu') \right).$$

We have seen that  $\alpha$  is a square in  $\phi$  so that  $\nu_{\phi}(\alpha) = 1$ . We also saw that

$$\nu_{\phi} \left( \prod_{\mu} N_{F_{\mu}/F} \beta(\mu') \right) = (-1)^a \nu_{\phi}(-1)^{\frac{q-1}{2}}$$

when  $t$  is even. The required relation follows.

We suppose henceforth that  $t$  is odd. The discussion will be fairly complicated. Suppose first that  $m$  is also odd. Then

$$[G_0 : G_1](m-1) \neq t$$

and

$$m-1 > \frac{t}{[G_0 : G_1]}$$

so that

$$\beta + \alpha(\mu') \equiv \beta \pmod{\mathfrak{P}_L}$$

and

$$\prod_{\mu} \Delta_3(\mu' \chi_{F_{\mu}/F}, \psi_{F_{\mu}/F}, \varpi_F^{m+n}) \sim_p (-1)^a \nu_{\phi} \left( k^{\frac{q-1}{k}} \right) \nu_{\phi} \left( \beta^{\frac{q-1}{k}} \right) A[\sigma(\varphi_{\phi})]^{\frac{q-1}{k}}.$$

Thus if  $\frac{q-1}{k}$  is odd we have to show that

$$(-1)^{a+1} \nu_{\phi}(k) \nu_{\phi}(-1)^{\frac{q-1}{2k} + \frac{1}{2}} \sim_p 1 \quad (14.4)$$

and if  $\frac{q-1}{k}$  is even we have to show that

$$\nu_{\phi}(\omega_1) \sim_p (-1)^a \nu_{\phi}(-1)^{\frac{q-1}{2k}}. \quad (14.5)$$

Now suppose  $m$  is even. If  $[G_0 : G_1]$  is 1 there is nothing to prove. If  $k = [G_0 : G_1]$  is even then

$$m - 1 > \frac{t}{[G_0 : G_1]}$$

and

$$\beta + \alpha(\mu') \equiv \beta \pmod{\mathfrak{P}_L}.$$

If

$$\psi'_{\phi_\mu}(x) = \psi_{F_\mu/F} \left( \beta \frac{\varpi_{F_\mu}^{k(m-1)} x}{\varpi_F^{m+n}} \right)$$

and  $\varphi'_{\phi_\mu}$  is a function on  $\phi_\mu$  which vanishes nowhere and satisfies

$$\varphi'_{\phi_\mu}(x + y) = \varphi'_{\phi_\mu}(x) \varphi'_{\phi_\mu}(y) \psi'_{\phi_\mu}(xy)$$

then

$$\Delta_3(\mu' \chi_{F_\mu/F}, \psi_{F_\mu/F}, \varpi_F^{m+n}) \sim_p A[-\sigma(\varphi'_{\phi_\mu})].$$

If

$$\varepsilon_\mu \varpi_F^{m-1} = \varpi_{F_\mu}^{k(m-1)}$$

then  $\varepsilon_\mu$  is a unit and

$$\psi_{\phi_\mu}(x) = \psi_{\phi_\mu/\phi}(k\beta\varepsilon_\mu x)$$

if, as before,

$$\psi_\phi(x) = \psi_F \left( \frac{x}{\varpi_F^{1+n}} \right).$$

By Lemma 9.1,  $A[-\sigma(\varphi_{\phi_\mu})]$  is equal to

$$-\nu_\phi \left( k^{\frac{[F_\mu:F]}{k}} \right) \nu_\phi \left( \beta^{\frac{[F_\mu:F]}{k}} \right) \nu_\phi(N_{\phi_\mu/\phi} \varepsilon_\mu) A[\sigma(\varphi_\phi)]^{\frac{[F_\mu:F]}{k}}.$$

If  $\frac{q-1}{k}$  is even we have to show that

$$(-1)^a \nu_\phi \left( \prod_\mu N_{\phi_\mu/\phi} \varepsilon_\mu \right) \nu_\phi(-1)^{\frac{q-1}{2k}} \sim_p 1 \quad (14.6)$$

If  $\frac{q-1}{k}$  is odd then  $m' = m(\chi_{E/F})$  is odd. If

$$\psi''_\phi(x) = \psi_{E/F} \left( \beta' \frac{\varpi_E^{m'-1} x}{\varpi_F^{m+n}} \right)$$

and  $\varphi''_\phi$  bears the usual relation to  $\psi''_\phi$  then

$$\Delta_3(\chi_{E/F}, \psi_{E/F}, \varpi_F^{m+n}) \sim_p A[-\sigma(\varphi''_\phi)].$$

Now  $\nu_\phi(\beta') = \nu_\phi(\beta')^q$  and

$$(\beta')^q \equiv N_{E/F}\beta'$$

which in turn is congruent to

$$\beta \prod_{\mu \in T} \prod_{\sigma \in M_\mu} (\beta + \alpha(\mu')^\sigma) \equiv \beta^q$$

modulo  $\mathfrak{P}_K$ . Let

$$\varepsilon_1 \varpi_F^{m+n} = \varpi_E^{q(m+n)}$$

and, as before,

$$\omega_1 = S_{E/F} \left( \frac{\varpi_F^{1+n}}{\varpi_E^{1+n'}} \right)$$

then

$$A[-\sigma(\varphi''_\phi)] \sim_p \nu_\phi(\omega_1) \nu_\phi(\varepsilon_1) \nu_\phi(\beta) A[-\sigma(\varphi_\phi)].$$

We saw that

$$\varpi_E^q \equiv \varpi_F \pmod{\mathfrak{P}_E^*}$$

so that

$$\varepsilon_1 \equiv 1 \pmod{\mathfrak{P}_E}.$$

Thus we have to show that

$$\nu_\phi(\omega_1) \sim_p (-1)^{a+1} \nu_\phi(k) \nu_\phi(-1)^{\frac{q-1}{2k}-\frac{1}{2}} \nu_\phi \left( \prod_\mu N_{\phi_\mu/\phi} \varepsilon_\mu \right). \quad (14.7)$$

The four identities (14.4), (14.5), (14.6), and (14.7) look rather innocuous. However to prove them is not an entirely trivial matter. We first consider the case that  $G/G_1$  is abelian. If  $\sigma_0 \in G/G_1$  is of order 2, the argument used before shows that  $\sigma_0 c \sigma_0^{-1} = c^{-1}$  for all  $c$  in  $C$ . Since the representation of  $G/G_1$  on  $C$  is faithful  $G/G_1$  has only one element of order 2 and is therefore cyclic. In this case  $F_\mu = L$  for all  $\mu$  and  $a = \frac{q-1}{[G:G_1]}$ . We may choose  $\varpi_{F_\mu} = \varpi_L$ . If

$$N_{L/F} \varpi_L = \gamma \varpi_F^{[G:G_0]}$$

then  $\gamma_\mu = \gamma^t$  and

$$\prod_\mu \gamma_\mu = \gamma^{at}.$$

If  $[G_0 : G_1] = 1$  we may choose  $\varpi_L = \varpi_F$  so that  $\gamma = 1$ . The argument used before shows that

$$\nu_\phi \left( \prod_{\mu \in T} \prod_{\sigma \in G/G_1} \beta(\mu')^\sigma \right) = (-1)^a \nu_\phi(-1)^{\frac{q-1}{2}}.$$

The identity (14.3) shows that

$$\nu_\phi(\omega_1) = (-1)^a \nu_\phi(-1)^{\frac{q-1}{2k}}.$$

The identity (14.5) which is the only one of concern here becomes

$$\nu_\phi(-1)^{\frac{q-1}{2}} = \nu_\phi(-1)^{\frac{q-1}{2k}}$$

which is clear because  $k = [G_0 : G_1] = 1$ .

Now take  $[G : G_0] = 1$ . We may choose  $\varpi_E = N_{K/E} \varpi_K$  so that  $\varpi_F = N_{L/F} \varpi_L$  and  $\gamma$  is again 1. It is perhaps worth pointing out these special choices are not inconsistent with any choices yet made in this paragraph. This is necessary because the arguments appearing in the functions  $\Delta_2$  must be the same as those appearing in the functions  $\Delta_3$ . We previously defined

$$\delta = \frac{\varpi_F^{1+n}}{\varpi_E^{1+n'}} \cdot \frac{\varpi_L^t}{\varpi_K^t}$$

and showed that

$$N_{K/L} \delta = \frac{\varpi_L^{t(q-1)}}{\varpi_F^{\frac{t(q-1)}{k}}}.$$

Observe that

$$\frac{\varpi_L^k}{\varpi_F} = \prod_{\sigma \in G/G_1} \varpi_L^{1-\sigma} \equiv \prod \theta_0(\sigma)^{-1} \equiv -1 \pmod{\mathfrak{P}_L}$$

because

$$\{\theta_0(\sigma) \mid \sigma \in G/G_1\}$$

is just the set of  $k$ th roots of unity in  $\phi$  and  $k$  is a power of 2. It is not 1 because

$$[G_0 : G_1] = [G : G_1] > 1.$$

Since

$$\delta^q \equiv N_{K/L} \delta \pmod{\mathfrak{P}_K}$$

we have

$$\nu_\phi(\delta) = \nu_\phi(-1)^{\frac{q-1}{k}}.$$

If as before

$$\psi_{L/F} \left( \frac{\beta_1(\nu)x}{\varpi_F^{1+n} \varpi_L^t} \right) = \nu(1+x)$$

for  $x$  in  $\mathfrak{P}_L^s$  and  $\nu$  in  $S(K/L)$  then, as we saw when proving the identity (14.3),

$$\omega_1^q \equiv \delta^q \alpha^q \left\{ \prod_{\nu \neq 1} \beta_1(\nu) \right\} \pmod{\mathfrak{P}_L}.$$

Thus

$$\nu_\phi(\omega_1) = \nu_\phi(-1)^{\frac{q-1}{k}} \prod_{\nu \neq 1} \nu_\phi(\beta_1(\nu)).$$

We can choose  $\frac{q-1}{p-1}$  elements  $\nu_i$  in  $S(K/L)$  so that every non-trivial element of  $S(K/L)$  is of the form  $\nu_i^j$ ,  $0 < j < p$ . Then

$$\prod_{\nu \neq 1} \nu_\phi(\beta_1(\nu)) = \nu_\phi \left( \prod_{i=1}^{\frac{q-1}{p-1}} \prod_{j=1}^{p-1} j\beta(\nu_i) \right) = \nu_\phi(-1)^{\frac{q-1}{p-1}}$$

because

$$\nu_\phi(\beta(\nu_i))^{p-1} = 1.$$

When  $m$  is even

$$\nu_\phi(\varepsilon_\mu) = \nu_\phi \left( \frac{\varpi_L^k}{\varpi_F} \right) = \nu_\phi(-1).$$

Since  $a = \frac{q-1}{k}$  the identities (14.4), (14.5), (14.6) and (14.7) become

$$\nu_\phi(k) \nu_\phi(-1)^{\frac{q-1}{2k} + \frac{1}{2}} = 1 \tag{14.4'}$$

$$\nu_\phi(-1)^{\frac{q-1}{p-1}} = \nu_\phi(-1)^{\frac{q-1}{2k}} \tag{14.5'}$$

$$\nu_\phi(-1)^{\frac{q-1}{2k}} = 1 \tag{14.6'}$$

$$\nu_\phi(-1)^{\frac{q-1}{k}} \nu_\phi(-1)^{\frac{q-1}{p-1}} = \nu_\phi(k) \nu_\phi(-1)^{\frac{q-1}{2k} + \frac{1}{2}} \nu_\phi(-1)^{\frac{q-1}{k}}. \tag{14.7'}$$

If  $p \equiv 1 \pmod{4}$  the identities (14.5') and (14.6') are clearly valid. Moreover for (14.5') and (14.6') the number  $\frac{q-1}{k}$  is even. Since  $k$  is a positive power of 2,  $q$  is an even power of  $p$  if  $p \equiv 3 \pmod{4}$ . If  $q = p^{2f}$  then

$$\frac{q-1}{p-1} = 1 + p + \dots + p^{2f-1} \equiv 0 \pmod{4}$$

and the left side of (14.5') is 1. If  $\frac{q-1}{2k}$  is even (14.5') and (14.6') are now clear. If it is odd, 4 divides  $k$  because 8 divides  $q-1$ . But  $\{\theta_0(\sigma) \mid \sigma \in G_0/G_1\}$  is the set of  $k$ th roots of unity in  $O_L/\mathfrak{P}_L = \phi$  so -1 is a square in  $\phi$ ,  $\nu_\phi(-1) = 1$ , and the relations are valid in this case too. The relations (14.4') and (14.7') are obvious if the degree of  $\phi$  over the prime field  $\phi_0$  is even. Since  $\phi^\times$  contains the  $k$ th roots of unity and  $k$  is a power of 2 the degree can be odd only if  $k$  divides  $p-1$ . Since

$$\frac{q-1}{k} = \frac{q-1}{p-1} \cdot \frac{p-1}{k}$$

and  $\frac{q-1}{k}$  is now odd  $\frac{p-1}{k}$  must also be odd and by quadratic reciprocity

$$\nu_\phi(k) = \nu_{\phi_0}(k) = \nu_{\phi_0}(-1) \nu_{\phi_0}\left(\frac{p-1}{k}\right) = \nu_{\phi_0}(-1) \nu_{\phi_0}(-1)^{\frac{p-1}{2k} - \frac{1}{2}}$$

because

$$p \equiv 1 \left( \text{mod } \frac{p-1}{k} \right).$$

If  $p \equiv 1 \pmod{4}$  the two relations are now clear. If  $p \equiv 3 \pmod{4}$  and  $q = p^f$

$$\frac{q-1}{p-1} = 1 + p + \dots + p^{f-1}$$

must be odd. It is therefore congruent to 1 modulo 4. (14.4') becomes

$$\nu_{\phi_0}(-1) \nu_{\phi_0}(-1)^{\frac{p-1}{k}} = 1$$

and (14.7') becomes

$$\nu_{\phi_0}(-1) = \nu_{\phi_0}(-1).$$

There is no question that both these relations are valid.

We have still to treat the case that  $G/G_1$  is abelian while neither  $[G : G_0]$  nor  $[G_0 : G_1]$  is 1. Then

$$N_{F_\mu/F} \beta(\mu') \equiv \left\{ \prod_{\sigma \in G/G_0} \beta(\mu') \right\}^k \pmod{\mathfrak{P}_{F_\mu}}$$

is a square in  $\phi$  and the identity (14.3) implies that

$$\nu_\phi(\omega_1) = \nu_\phi(\gamma^a)$$

$C_F/N_{L/F}C_L$  is cyclic of order  $[G : G_1]$ . It has a generator which contains an element of the form  $\gamma_1 \varpi_F$ . Moreover the coset of

$$(\gamma_1 \varpi_F)^{[G:G_0]} N_{L/F} \varpi_L^{-1} = \gamma_1^{[G:G_0]} \gamma^{-1}$$

is a generator of  $U_F/U_F \cap N_{L/F}C_L$ . The order of this group is a power of 2 and  $p$  is odd so every element of  $U_F \cap N_{L/F}C_L$  is a square. Consequently  $\gamma$  cannot be a square and  $\nu_\phi(\gamma) = -1$ . If  $m$  is even and  $F'$  is the fixed field of  $G_0$  then

$$\varepsilon_\mu = \left( \frac{\varpi_L^k}{\varpi_F} \right)^{m-1} = \left( \frac{N_{L/F'}\varpi_L}{\varpi_F} \right)^{m-1} \left( \prod_{\sigma \in G_0/G_1} \varpi_L^{1-\sigma} \right)^{m-1}$$

which is congruent to

$$- \left( \frac{N_{L/F'}\varpi_L}{\varpi_F} \right)^{m-1}$$

modulo  $\mathfrak{P}_L$ . Since  $[F' : F]$  is even

$$N_{\phi_\mu/\phi} \varepsilon_\mu = N_{F'/F} \varepsilon_\mu = \left( \frac{N_{L/F}\varpi_L}{\varpi_F^{[G:G_0]}} \right)^{m-1} = \gamma^{m-1}$$

and

$$\nu_\phi(N_{\phi_\mu/\phi} \varepsilon_\mu) = \nu_\phi(\gamma) = -1.$$

Because

$$a = \frac{q-1}{[G : G_1]}$$

is integral,  $\frac{q-1}{k}$  is even, and we need only worry about the identities (14.5) and (14.6). They both reduce to

$$\nu_\phi(-1)^{\frac{q-1}{2k}} = 1.$$

To prove this we show that  $\frac{q-1}{2k}$  is even if  $\nu_\phi(-1) = -1$ . Since

$$k = [U_F : U_F \cap N_{L/F}C_L]$$

and this index must divide the order of  $\phi^*$  the number  $\nu_\phi(-1)$  is -1 only if  $k = 2$ . Of course  $p$  will be congruent to 3 modulo 4. Since 4 divides  $q-1$ ,  $q$  is an even power of  $p$  and  $q \equiv 1 \pmod{8}$ . Thus

$$\frac{q-1}{2k} = \frac{q-1}{4}$$

is even.

Now suppose that  $G/G_1$  is not abelian. Let  $\sigma \longrightarrow x(\sigma)$  be a given isomorphism of  $G_0/G_1$  with  $\mathbb{Z}/k\mathbb{Z}$  and let  $x \longrightarrow \sigma(x)$  be its inverse. Let  $\tau \longrightarrow \lambda(\tau)$  be that homomorphism of  $G/G_0$  into the units of  $\mathbb{Z}/k\mathbb{Z}$  which satisfies

$$x(\tau\sigma\tau^{-1}) = \lambda(\tau)x(\sigma).$$

There is precisely one element of order 2 in  $G_0/G_1$ , namely  $\sigma\left(\frac{k}{2}\right)$ , and it lies in the center of  $G/G_1$ . Since  $G/G_0$  is cyclic,  $G/G_1$  is non-abelian only if  $k > 2$ . Choose a fixed  $\sigma_0$  in  $G$  which generates  $G/G_0$  and set

$$\mu_0 = \lambda(\sigma_0)$$

and

$$y_0 = x(\sigma_0^{[G:G_0]}).$$

We shall sometimes regard  $C$  as a vector space over the field with  $p$  elements. If  $\sigma$  belongs to  $G/G_1$  let  $\pi(\sigma)$  be the linear transformation

$$c \longrightarrow \sigma c \sigma^{-1}.$$

The dual space will be identified with  $S(K/L)$  and  $\pi^*$  will be the representation contragredient to  $\pi$ .

The relation

$$N_{F_\mu/F} \beta(\mu') \equiv \left\{ \prod_{\sigma \in G/G_\mu G_0} \beta(\mu')^\sigma \right\}^k$$

together with the identity (14.3) implies that

$$\nu_\phi(\omega_1) = \nu_\phi \left( \prod_\mu \gamma_\mu \right).$$

Moreover if  $m$  is even and  $F'_\mu$  is the fixed field of  $G_\mu G_0$

$$\varepsilon_\mu = \left( \frac{\varpi_{F_\mu}^k}{\varpi_F} \right)^{m-1} = \left\{ \frac{N_{F_\mu/F'_\mu} \varpi_{F_\mu}}{\varpi_F} \right\}^{m-1} \left\{ \prod_{\sigma \in G_0/G_1} \varpi_{F_\mu}^{1-\sigma} \right\}^{m-1}$$

which is congruent to

$$\left\{ -\frac{N_{F_\mu/F'_\mu} \varpi_{F_\mu}}{\varpi_F} \right\}^{m-1}$$

modulo  $\mathfrak{P}_{F_\mu}$ . Since

$$\{N_{\phi_\mu/\phi} \varepsilon_\mu\}^t = N_{F'_\mu/F} \left\{ -\frac{N_{F_\mu/F'_\mu} \varpi_{F_\mu}}{\varpi_F} \right\}^{(m-1)t}$$

which equals

$$(-1)^{t[\phi_\mu:\phi]} \gamma_\mu^{m-1}$$

and  $t$  is odd

$$\nu_\phi(N_{\phi_\mu/\phi} \varepsilon_\mu) = \nu_\phi(-1)^{[\phi_\mu:\phi]} \nu_\phi(\gamma_\mu).$$

These relations will be used frequently and without comment.

I want to discuss the case  $[G : G_0] = 2$  and  $\mu_0 \equiv -1 \pmod{4}$  first. Since

$$(-\mu_0)^2 = \mu_0^2 = \lambda(\sigma_0^2) \equiv 1 \pmod{k}$$

we must have

$$-\mu_0 \equiv 1 \pmod{k}$$

or, if  $k > 4$ ,

$$-\mu_0 \equiv \frac{k}{2} + 1 \pmod{k}.$$

Then

$$\mu_0 \equiv -1 \pmod{k}$$

or

$$\mu_0 \equiv \frac{k}{2} - 1 \pmod{k}.$$

Since

$$\mu_0 - 1 \equiv 2 \pmod{4}$$

the centralizer of  $\sigma_0$  in  $G_0/G_1$  consists of the identity and  $\sigma \left( \frac{k}{2} \right)$ . Thus  $x(\sigma_0^2)$  is 0 or  $\frac{k}{2}$ .

Suppose  $\mu_0 \equiv -1 \pmod{k}$  and  $x(\sigma_0^2) = \frac{k}{2}$ . If  $\sigma$  belongs to  $G_0/G_1$  then  $\sigma_0 \sigma \sigma_0^{-1} = \sigma^{-1}$  and  $(\sigma_0 \sigma)^2 = \sigma_0^2$ . Thus  $\sigma \left( \frac{k}{2} \right)$  is the only element of order 2 in  $G/G_1$ . If  $\sigma$  belongs to  $G/G_1$  then  $\sigma$  has a non-trivial fixed point in  $S(K/L)$  if and only if  $\pi(\sigma)$  has 1 as an eigenvalue. If  $\sigma \neq 1$  there is an integer  $n$  such that  $\sigma^n$  has order 2. Then  $\pi(\sigma^n)$  also has 1 as an eigenvalue. Thus if any non-trivial element of  $G/G_1$  has a non-trivial fixed point there is an element  $\tau$  of order 2 such that  $\pi(\tau)$  has 1 as an eigenvalue. The usual argument shows that

$$\pi \left( \sigma \left( \frac{k}{2} \right) \right) = -I$$

so that, in the case under consideration, only the identity has fixed points. Then

$$a = \frac{q-1}{[G : G_1]}.$$

In particular  $\frac{q-1}{k}$  is even. We choose  $\varpi_{F_\mu} = \varpi_L$  and let

$$\gamma \varpi_F^{[G:G_0]} = N_{L/F} \varpi_L.$$

Only identities (14.5) and (14.6) are to be considered. (14.5) reduces to

$$\nu_\phi(\gamma)^{at} = (-1)^a \nu_\phi(-1)^{\frac{q-1}{2k}}$$

and (14.6) reduces to

$$(-1)^a \nu_\phi(-1)^{a[G:G_0]} \nu_\phi(\gamma)^{at} \nu_\phi(-1)^{\frac{q-1}{2k}} = 1.$$

Since  $[G : G_0]$  is even they are equivalent. Suppose  $\phi$  has  $r$  elements. If  $x \in \lambda = O_L/\mathfrak{P}_L$  then  $x^{\sigma_0} = x^{r^f}$  for some  $f$ . If  $\sigma$  belongs to  $G_0/G_1$  then

$$\theta_0(\sigma)^{\mu_0 r^f} = \theta_0(\sigma_0 \sigma \sigma_0^{-1})^{r^f} \equiv \left( \frac{\varpi_L^{\sigma_0 \sigma}}{\varpi_L^{\sigma_0}} \right)^{r^f \sigma_0^{-1}} \equiv \theta_0(\sigma).$$

Thus

$$\mu_0^{r^f} \equiv 1 \pmod{k}$$

and

$$r \equiv -1 \pmod{4}$$

so that  $\nu_\phi(-1) = -1$ . Since, in the present case,

$$a = \frac{q-1}{2k}$$

the identities become

$$\nu_\phi(\gamma)^{at} = 1.$$

The map

$$\tau_{L/F} : W_{L/F} \longrightarrow C_F$$

determines a map of  $G/G_1$  onto  $C_F/N_{L/F}C_L$ . The image of  $\sigma_0$  contains an element of the form  $\gamma_1 \varpi_F$  where  $\gamma_1$  is a unit. The image of  $\sigma_0^2$  is 1 because the commutator subgroup contains

$$\{\sigma((\mu_0 - 1)x)\} = \{\sigma(x) \mid x \equiv 0 \pmod{2}\}$$

and in particular contains  $\sigma_0^2$ . Since  $[G : G_0] = 2$  the number  $\gamma \gamma_1^{-2}$  lies in  $U_F \cap N_{L/F}C_L$ . The index of the commutator subgroup of  $G/G_1$  in  $G/G_1$  is 4 so

$$[U_F : U_F \cap N_{L/F}C_L] = 2.$$

Consequently  $\gamma\gamma_1^{-2}$  and  $\gamma$  are both squares and  $\nu_\phi(\gamma) = 1$ .

Now suppose  $\mu_0 \equiv -1 \pmod{k}$  and  $x(\sigma_0^2) = 0$ . Every element of the form  $\sigma_0\sigma$ ,  $\sigma \in G_0/G_1$ , has order 2. If  $\pi(\sigma_0\sigma) = -I$  then  $\sigma_0\sigma$  lies in the center of  $G/G_1$  which is impossible. Thus  $\pi(\sigma_0\sigma)$  has 1 as an eigenvalue. If  $\tau \in G_0/G_1$  then

$$\tau^{-1}\sigma_0\sigma\tau = \sigma_0\sigma\tau^2$$

so there are two conjugacy classes in the set  $\sigma_0 G_0/G_1$ . One has  $\sigma_0$  as representative and the other has  $\sigma_1 = \sigma_0\sigma(1)$ .

Let  $V$  be a non-trivial subspace of  $S(K/L)$  invariant and irreducible under the action of  $G_0/G_1$ . Suppose first that  $V$  is also invariant under  $\pi^*(\sigma_0)$  so that  $V = S(K/L)$ . Choose  $v_0 \neq 0$  so that  $\pi^*(\sigma_0)v_0 = v_0$ . Let  $\lambda'$  be the field obtained by adjoining the  $k$ th roots of unity to the prime field. Certainly  $\lambda' \subseteq \lambda$  and, since

$$\theta_0(\sigma)^{\sigma_0} = \theta_0(\sigma_0^{-1}\sigma\sigma_0),$$

$\lambda'$  is not contained in  $\phi$ . Let  $\phi' = \phi \cap \lambda'$ . We may regard  $\{1, \sigma_0\}$  as  $\mathfrak{G}(\lambda'/\phi')$ . The map  $\varphi$  which sends  $\sigma$  in  $G_0/G_1$  to  $(\theta_0^{-1}(\sigma), 1)$  and  $\sigma\sigma_0$  to  $(\theta_0^{-1}(\sigma), \sigma_0)$  is an isomorphism of  $G/G_1$  with the semi-direct product of the  $k$ th roots of unity in  $\lambda'$  and  $\mathfrak{G}(\lambda'/\phi')$ . There is a unique map, again denoted by  $\varphi$ , of  $V$  onto  $\lambda'$  such that  $\varphi(v_0) = 1$  while

$$\varphi(\pi^*(\tau)v) = \varphi(\tau)\varphi(v)$$

for  $\tau$  in  $G/G_1$ . Of course the  $k$ th roots of unity act on  $\lambda'$  by left multiplication. The Galois group acts by  $\sigma_0\alpha = \alpha^{\sigma_0^{-1}}$ . Putting the actions together we get an action of the semi-direct product. To study the action of  $G/G_1$  on  $V$  we study the equivalent action of the semi-direct product in  $\lambda'$ .

It is best to consider a more general situation. Suppose  $\phi'$  is a finite field with  $p^f$  elements,  $\lambda'$  is an extension of  $\phi'$  with  $p^\ell$  elements and  $\Gamma$  is the semi-direct product of the group of  $k$ th roots of unity, where  $k$  divides  $p^\ell - 1$ , and  $\mathfrak{G}(\lambda'/\phi')$ .  $\Gamma$  acts on  $\lambda'$  as before. Let  $\ell = nf$ . If  $0 \leq j_1 < n$ ,  $j = (j_1, n)$ , and  $\rho$  is the automorphism  $x \rightarrow x^{p^f}$  of  $\lambda'/\phi'$  then the number of elements of  $\lambda'$  fixed by a member of  $\Gamma$  of the form  $(\alpha, \rho^{j_1})$  where  $\alpha$  is a  $k$ th root of unity is the same as the number of elements fixed by some other member of the form  $(\beta, \rho^{-j})$ . Indeed if

$$b \frac{j_1}{j} \equiv -1 \pmod{\frac{n}{j}}$$

and  $b$  is prime to the order of  $(\alpha, \rho^{j_1})$  we can take

$$(\beta, \rho^{-j}) = (\alpha, \rho^{j_1})^b.$$

Let  $\theta$  be a generator of the multiplicative group of  $\lambda'$ . The equation

$$\beta \theta^m \rho^j = \theta^m$$

can be solved for  $\beta$  if and only if  $\theta^{m(p^{jf}-1)}$  has order dividing  $k$ , that is, if and only if  $p^\ell - 1$  divides  $km(p^{jf} - 1)$  or, if

$$u = \frac{p^\ell - 1}{k}$$

if and only if  $u$  divides  $m(p^{jf} - 1)$ . Let  $u(j)$  be the greatest common divisor of  $u$  and  $p^{jf} - 1$ .  $u$  divides  $m(p^{jf} - 1)$  if and only if  $\frac{u}{u(j)}$  divides  $m$ . The number of such  $m$  with  $0 \leq m < p^\ell - 1$  is

$$\frac{u(j)}{u} (p^\ell - 1) = u(j)k.$$

Once  $m$  and  $j$  are chosen  $\alpha$  is determined. The number of non-zero  $x$  in  $\lambda'$  which are fixed by some  $(\beta, \rho^{-j})$  where  $j$  divides  $n$  but by no  $(\beta, \rho^{-i})$  where  $i$  properly divides  $j$  is

$$\sum_{i|j} \mu\left(\frac{j}{i}\right) u(i)k$$

if  $\mu(\cdot)$  is the Möbius function. The number of orbits formed by such  $x$  is

$$\frac{1}{jk} \sum_{i|j} \mu\left(\frac{j}{i}\right) u(i)k$$

so that the total number of orbits of  $\Gamma$  in the multiplicative group of  $\lambda'$  is

$$a = \sum_{i|n} \sum_{j|\frac{n}{i}} \frac{\mu(j)}{ij} u(i)$$

which equals

$$\sum_{i|n} \prod_{\pi|\frac{n}{i}} \left(1 - \frac{1}{\pi}\right) \frac{u(i)}{i}.$$

The product is over primes.

**Lemma 14.7**

If  $\frac{p^\ell-1}{k}$  is odd then

$$(-1)^{a+1} \nu_{\phi'}(k) \nu_{\phi'}(-1)^{\frac{p^\ell-1}{2k} + \frac{1}{2}} = 1.$$

The identity of the lemma is equivalent to

$$(-1)^{a+1} \nu_{\phi'}(u) \nu_{\phi'}(-1)^{\frac{u-1}{2}} = 1$$

because

$$\nu_{\phi'}(k) = \nu_{\phi'}(-1) \nu_{\phi'}(u).$$

By the law of quadratic reciprocity the left side of the identity is equal to

$$(-1)^{a+1} (p^f | u)$$

if  $(p^f | u)$  is Jacobi's symbol. If  $u = 1$  there is only one orbit so

$$(-1)^{a+1} = 1.$$

Of course  $(p^f | 1) = 1$  so the identity is clear in this case.

We prove it in general by induction on the number of prime factors of  $u$ . Let  $\pi_0$  be a prime factor of  $u$  and let  $u = \pi_0^x v$  with  $v$  prime to  $\pi_0$ . Let  $v(j)$  be the analogue of  $u(j)$ . Then  $u(j) = \pi_0^{x(j)} v(j)$ . Let  $b$  be the analogue of  $a$ . Then

$$\nu = a - b = \sum_{i|n} \prod_{\pi \mid \frac{n}{i}} \left(1 - \frac{1}{\pi}\right) \frac{v(i)}{i} (\pi_0^{x(i)} - 1).$$

Observe that  $\pi_0$  and all  $v(i)$  are odd. To prove the lemma by induction we must show that

$$(-1)^\nu (p^f | \pi_0^x) = 1. \tag{14.8}$$

Let

$$n = 2^y n_1$$

with  $n_1$  odd. There are two possibilities to be considered.

(i)

$$\pi_0 \equiv 1 \pmod{2^{y+1}}.$$

Since the order of  $p^f$  modulo  $\pi_0$  divides  $n$  the quotient of  $\pi_0 - 1$  by this order is even and  $p^f$  is a quadratic residue of  $\pi_0$ . Also if  $i$  divides  $n$

$$\frac{\pi_0^{x(i)} - 1}{i}$$

is divisible, in the 2-adic field, by 4 if 2 divides  $\frac{n}{i}$  and is always divisible by 2. Thus  $\nu$  is even and (14.8) is valid.

(ii)

$$\pi_0 = 1 + 2^c w$$

with  $c \leq y$  and  $w$  odd. Let  $i \neq n_1$  divide  $n_1$  and consider

$$\sum_{j=0}^y \prod_{\pi | \frac{n}{2^j i}} \left(1 - \frac{1}{\pi}\right) \frac{v(2^j i)}{2^j i} (\pi_0^{x(2^j i)} - 1). \quad (14.9)$$

If  $x(2^y i) = 0$  the sum is zero. If  $x(2^y i) \neq 0$  let  $z$  be the smallest integer for which  $x(2^z i) \neq 0$ . If  $j < z$  then  $x(2^j i) = 0$ . If  $j \geq z$

$$p^{2^j i f} - 1 = (p^{2^z i f} - 1) \left( \sum_{d=0}^{2^{j-z}-1} p^{2^z c i f} \right).$$

The residue of the sum modulo  $\pi_0$  is  $2^{j-z}$ . Thus

$$x(2^j i) = x(2^z i)$$

if  $j \geq z$  and (14.9) is equal to

$$\frac{1}{i} \left\{ \prod_{\pi | \frac{n_1}{i}} \left(1 - \frac{1}{\pi}\right) \right\} \left\{ \frac{v(2^y i)}{2^y} + \sum_{j=z}^{y-1} \frac{v(2^j i)}{2^{j+1}} \right\} (\pi_0^{x(2^y i)} - 1).$$

We write

$$\frac{v(2^y i)}{2^y} + \sum_{j=z}^{y-1} \frac{v(2^j i)}{2^{j+1}}$$

as

$$\frac{v(2^z i)}{2^z} + \sum_{j=z+1}^y \frac{v(2^j i) - v(2^{j-1} i)}{2^j}.$$

If  $k$  is replaced by  $\frac{p^\ell - 1}{v}$  the number of elements of  $\lambda^*$  fixed by some  $(\alpha, \rho^{-2^j i})$  but by no  $(\alpha, \rho^{-2^{j-1} i})$  is

$$\{v(2^j i) - v(2^{j-1} i)\} \frac{p^\ell - 1}{v}.$$

The collection of such elements is invariant under the group obtained by replacing  $k$  by  $\frac{p^\ell-1}{v}$  and  $\phi'$  by the field with  $p^{if}$  elements. The isotropy group of each such point has a generator of the form  $(\alpha, \rho^{-2^j i})$  and, therefore, has order  $\frac{n}{2^j i}$  and index  $\frac{2^j(p^\ell-1)}{v}$ . Thus  $\frac{2^j(p^\ell-1)}{v}$  divides

$$\{v(2^j i) - v(2^{j-1} i)\} \frac{p^\ell - 1}{v}$$

so that  $2^j$  divides

$$v(2^j i) - v(2^{j-1} i).$$

Since  $\frac{n_1}{i}$  is divisible by at least one prime, the expression (14.9) is congruent, in the 2-adic field, to

$$\frac{1}{i} \left\{ \prod_{\pi \mid \frac{n_1}{i}} \left( 1 - \frac{1}{\pi} \right) \right\} \frac{v(2^z i)}{2^z} \left( \pi^{x(2^y i)} - 1 \right)$$

modulo 4. Since  $z \leq c$  and the product is not empty this is congruent, in the 2-adic field again, to 0 modulo 2. Thus  $\nu$  is even or odd according as

$$\sum_{j=0}^y \left\{ \prod_{\pi \mid 2^{y-j}} \left( 1 - \frac{1}{\pi} \right) \right\} \frac{v(2^j n_1)}{2^j n_1} \left( \pi_0^{x(2^j n_1)} - 1 \right)$$

is or is not divisible by 2 in the 2-adic field. Consequently

$$\nu \equiv \sum_{j=0}^y \left\{ \prod_{\pi \mid 2^{y-j}} \left( 1 - \frac{1}{\pi} \right) \right\} \frac{v(2^j n_1)}{2^j} \left( \pi_0^{x(2^j n_1)} - 1 \right) \pmod{2}.$$

Of course  $x(2^y n_1) = x \neq 0$ . Let  $z$  again be the smallest integer for  $x(2^z n_1) \neq 0$ . Then  $z \leq c$  and

$$x(2^j n_1) = x(2^z n_1)$$

if  $j \geq z$ . The sum above is equal to

$$\left\{ \frac{v(2^z n_1)}{2^z} + \sum_{j=z+1}^y \frac{v(2^j n_1) - v(2^{j-1} n_1)}{2^j} \right\} (\pi_0^x - 1).$$

As before this is congruent modulo 2 to

$$\frac{v(2^z n_1)}{2^z} (\pi_0^x - 1).$$

If  $z < c$  this is even and the order of  $p$  modulo  $\pi_0$  divides  $\frac{\pi_0-1}{2}$  so that  $(p|\pi_0) = 1$ . If  $z = c$  then

$$\frac{\pi_0^x - 1}{2^z} = \frac{1}{2^c} \sum_{i=1}^x \binom{x}{i} (2^c w)^i \equiv x \pmod{2}$$

so that  $\nu \equiv x \pmod{2}$ . However the order of  $p^f$  modulo  $\pi_0$  is divisible by  $2^z$  so that it does not divide  $\frac{\pi_0-1}{2}$  and

$$(p^f \mid \pi_0^x) = (-1)^x.$$

The relation (14.8) is now easily verified.

We return to the original problem. Since  $\lambda'$  is a quadratic extension of  $\phi'$  and  $\lambda'$  is not contained in  $\phi$  the degree of  $\phi$  over  $\phi'$  is odd. Since  $V$  and  $\lambda'$  have the same number of elements  $q = p^\ell$ . If  $\frac{q-1}{k}$  is odd the relation (14.4) follows immediately from the equality

$$(-1)^{a+1} \nu_\phi(k) \nu_\phi(-1)^{\frac{q-1}{2k} + \frac{1}{2}} = (-1)^{a+1} \nu_{\phi'}(k) \nu_{\phi'}(-1)^{\frac{q-1}{2k} + \frac{1}{2}}$$

and the preceding lemma.

The number of  $\mu$  in  $T$  with isotropy group of order 2 is  $u(1)$  and the number of  $\mu$  with trivial isotropy group is  $\frac{u(2)-u(1)}{2}$ . For points of the second type  $[\phi_\mu : \phi] = 2$  and for points of the first type  $[\phi_\mu : \phi] = 1$ . Since, as we verified earlier,

$$\nu_\phi(\omega_1) = \nu_\phi\left(\prod_\mu \gamma_\mu\right)$$

and

$$\nu_\phi(N_{\phi_\mu/\phi} \varepsilon_\mu) = \nu_\phi(-1)^{[\phi_\mu:\phi]} \nu_\phi(\gamma_\mu)$$

the identity (14.7) reduces to

$$u(1) \equiv 1 \pmod{2}$$

which is true because  $u(1)$  divides  $u = \frac{p^\ell-1}{k}$  which, when (14.7) is under consideration, is odd by assumption.

The identity (14.5) may be formulated as

$$\nu_\phi\left(\prod_\mu \gamma_\mu\right) = (-1)^a \nu_\phi(-1)^{\frac{q-1}{2k}}$$

and (14.6) as

$$\nu_\phi\left(\prod_\mu \gamma_\mu\right) \nu_\phi(-1)^{\sum_\mu [\phi_\mu:\phi]} = (-1)^a \nu_\phi(-1)^{\frac{q-1}{2k}}.$$

For these two identities  $\frac{q-1}{k}$  is even. Again

$$\sum [\phi_\mu : \phi] \equiv u(1) \pmod{2}.$$

But

$$u(2) = u = \frac{p^\ell - 1}{k} = \frac{q - 1}{k}$$

and

$$2a = u(1) + u(2)$$

so  $u(1)$  is even. It will be enough to verify (14.5).

We may choose  $T$  so that if  $\mu$  is in  $T$  then its isotropy group is trivial or contains one of  $\sigma_0$  or  $\sigma_1$ . If  $\sigma_0$  lies in the isotropy group of  $\mu$  and  $\nu$  in the orbit of  $\mu$  corresponds to  $\theta^m$  in  $\lambda'$  then

$$\alpha^2 \theta^{m\rho} = \theta^m$$

for some  $k$ th root of unity  $\alpha$ . This is possible if and only if  $p^\ell - 1$  divides  $\frac{km}{2}(p^f - 1)$  or  $2u$  divides  $m(p^f - 1)$ . This is the same as requiring that  $\frac{2u}{u(1)}$  divide  $\frac{m(p^f - 1)}{u(1)}$ . The number  $u$  is even. We have already observed that if  $r$  is the number of elements in  $\phi$  so that  $x^{\sigma_0} = x^r$  for  $x$  in  $\phi$  then

$$\mu_0 r \equiv 1 \pmod{k}$$

and in particular

$$\mu_0 r \equiv 1 \pmod{4}.$$

Since  $[\phi : \phi']$  is odd and  $\mu_0 \equiv -1 \pmod{4}$  the highest power of 2 dividing  $p^f - 1$  is 2. Thus  $\frac{2u}{u(1)}$  and  $\frac{p^f - 1}{u(1)}$  are relatively prime so that  $\frac{2u}{u(1)}$  divides  $\frac{m(p^f - 1)}{u(1)}$  if and only if  $\frac{2u}{u(1)}$  divides  $m$ . There are  $\frac{u(1)k}{2}$  such  $m$  with  $0 \leq m < p^\ell - 1$ . The corresponding characters  $\nu$  fall into  $\frac{u(1)}{2}$  orbits. Thus there are  $\frac{u(1)}{2}$  elements in  $T$  whose isotropy group contains  $\sigma_0$  and  $\frac{u(1)}{2}$  whose isotropy group contains  $\sigma_1$ . Let  $L_0$  be the fixed field of  $\sigma_0$  and  $L_1$  the fixed field of  $\sigma_1$ . Let  $\varpi_{L_0}$  and  $\varpi_{L_1}$  generate  $\mathfrak{P}_{L_0}$  and  $\mathfrak{P}_{L_1}$  respectively and let

$$N_{L_0/F} \varpi_{L_0} = \gamma_0 \varpi_F$$

$$N_{L_1/F} \varpi_{L_1} = \gamma_1 \varpi_F$$

$$N_{L/F} \varpi_L = \gamma \varpi_F^2.$$

We have to show that

$$\nu_\phi \left( \gamma_0^{\frac{u(1)}{2}} \gamma_1^{\frac{u(1)}{2}} \gamma^{\frac{u(2)-u(1)}{2}} \right) = (-1)^a \nu_\phi(-1)^{\frac{q-1}{2k}}.$$

First we prove a lemma, special cases of which we have already seen.

**Lemma 14.8**

Suppose  $L/F$  is normal but non-abelian and  $[L : F]$  is a power of 2. Suppose  $H = \mathfrak{G}(L/F)$  and the first ramification group  $H_1$  is  $\{1\}$  but  $[H : H_0] > 1$  and  $[H_0 : H_1] > 1$ . Let  $\varpi_L$  generate the prime ideal of  $O_L$ , let  $\varpi_F$  generate the prime ideal of  $O_F$ , and let

$$N_{L/F} \varpi_L = \gamma \varpi_F^{[H:H_0]}.$$

Then  $\gamma$  is a square in  $U_F$ .

The hypotheses imply that the residue field has odd characteristic. Let  $A$  be the fixed field of  $H_0$  and  $L'$  be the fixed field of the commutator subgroup of  $H$ . Then  $A \subseteq L'$  and if

$$\varpi_{L'} = N_{L/L'} \varpi_L$$

then

$$N_{L'/F} \varpi_{L'} = \gamma \varpi_F^{[A:F]}.$$

Of course  $[A : F] = [H : H_0]$ . Since  $H$  is nilpotent but not abelian  $L'$  cannot be a cyclic extension. If  $\gamma$  is not a square in  $U_F$  then  $\gamma^{-1}$  generates  $U_F/U_F \cap N_{L'/F} C_L$ . Since

$$\varpi_F^{[A:F]} \equiv \gamma^{-1} \pmod{N_{L'/F} C_L}.$$

$\varpi_F$  would then generate  $C_F/N_{L'/F} C_L$  which is impossible.

Returning to the problem at hand, we observe that the quotient of  $G/G_1$  by the squares in  $G_0/G_1$  is a group of order 4 in which every square is 1. The fixed field  $F'$  of this group is the composite of all quadratic extensions of  $F$ .  $F_0 = F' \cap L_0$  and  $F_1 = F' \cap L_1$  are the two different ramified quadratic extensions of  $F$ . Define

$$\varpi_{F_0} = N_{L_0/F_0} \varpi_{L_0}$$

and

$$\varpi_{F_1} = N_{L_1/F_1} \varpi_{L_1}.$$

Then

$$N_{F_0/F} \varpi_{F_0} = \gamma_0 \varpi_F$$

and

$$N_{F_1/F} \varpi_{F_1} = \gamma_1 \varpi_F.$$

We need to show that

$$\nu_\phi(\gamma_0\gamma_1) = \nu_\phi\left(\frac{\gamma_0}{\gamma_1}\right) = -1.$$

If not,  $\frac{\gamma_0}{\gamma_1}$  is a square and thus in  $N_{F_1/F}C_{F_1}$ . Then  $\gamma_0\varpi_F$  belongs to

$$N_{F_0/F}C_{F_0} \cap N_{F_1/F}C_{F_1} = N_{F'/F}C_{F'}.$$

This is impossible because  $F'$  contains an unramified extension.

We observed before that since

$$\mu_0 = \lambda(\sigma_0) \equiv -1 \pmod{4}$$

the number  $\nu_\phi(-1)$  is  $-1$ . The identity (14.5) reduces to

$$(-1)^{\frac{u(1)}{2}} = (-1)^a (-1)^{\frac{q-1}{2k}}.$$

Since

$$a = \frac{u(1)}{2} + \frac{u(2)}{2}$$

and

$$u(2) = \frac{q-1}{k}$$

this relation is clearly valid.

We continue to suppose that  $\mu_0 \equiv -1 \pmod{k}$  and that  $\sigma_0^2 = 1$  but now we suppose that  $V$  is not invariant under  $\pi^*(\sigma_0)$ . Since  $\pi^*(\sigma_0)V \cap V$  and  $\pi^*(\sigma_0)V + V$  are both invariant under  $G/G_1$  the first is 0 and the second is  $S(K/L)$  so that  $S(K/L)$  is the direct sum  $V \oplus \pi^*(\sigma_0)V$ . Let  $V$  have  $p^\ell$  elements so that  $q = p^{2\ell}$ . If  $\lambda'$  is again the field generated over the prime field by the  $k$ th roots of unity  $\lambda'$  has  $p^\ell$  elements. If  $\phi' = \lambda' \cap \phi$  has  $p^f$  elements then  $p^\ell = p^{2f}$  so that  $p^\ell \equiv 1 \pmod{8}$ . Also  $k$  divides  $p^\ell - 1$  so that

$$\frac{q-1}{k} = \left(\frac{p^\ell-1}{k}\right) (p^\ell+1)$$

is even.

If  $\sigma \in G_0/G_1$  the non-zero fixed points of  $\sigma_0\sigma$  are the elements of the form

$$v \oplus \pi^*(\sigma_0\sigma)v$$

with  $v \neq 0$ . There are  $(p^\ell - 1)k$  of them altogether and they fall into  $p^\ell - 1$  orbits. The remaining

$$(p^{2\ell} - 1) - (p^\ell - 1)k$$

elements fall into

$$\frac{1}{2k} \{(p^{2\ell} - 1) - (p^\ell - 1)k\}$$

orbits. Thus

$$a = \frac{p^\ell - 1}{2} + \frac{p^{2\ell} - 1}{2k}.$$

Since, for the same reasons as before,  $\nu_\phi(-1) = -1$  the identity (14.5) becomes

$$\nu_\phi \left( \prod_\mu \gamma_\mu \right) = (-1)^{\frac{p^\ell - 1}{2}} \quad (14.10)$$

while (14.6) becomes

$$\nu_\phi \left( \prod_\mu \gamma_\mu \right) \nu_\phi(-1)^{\sum [\phi_\mu : \phi]} = (-1)^{\frac{p^\ell - 1}{2}}.$$

Since

$$\sum [\phi_\mu : \phi] \equiv p^\ell - 1 \equiv 0 \pmod{2}$$

only (14.5) need be proved. (14.4) and (14.7) are not to be considered because  $\frac{q-1}{k}$  is even.

We proceed as before. The points in  $T$  can be chosen so that their isotropy groups are either trivial or contain  $\sigma_0$  or  $\sigma_1$ .  $\frac{p^\ell - 1}{2}$  will have isotropy groups containing  $\sigma_0$  and  $\frac{p^\ell - 1}{2}$  will have isotropy groups containing  $\sigma_1$ . The argument used above shows that the left side of (14.10) is equal to

$$(-1)^{\frac{p^\ell - 1}{2}}$$

as desired.

Now suppose  $k \geq 8$  and

$$\mu_0 = \lambda(\sigma_0) \equiv \frac{k}{2} - 1 \pmod{k}.$$

We are of course still supposing that  $[G : G_0] = 2$ . If  $\sigma$  belongs to  $G_0/G_1$  then

$$\sigma \sigma_0 \sigma^{-1} = \sigma_0 \sigma^{\frac{k}{2} - 2}$$

and

$$(\sigma_0 \sigma)^2 = \sigma_0^2 \sigma^{\frac{k}{2}}.$$

Thus

$$x((\sigma_0\sigma)^2) = x(\sigma_0^2) + \frac{k}{2} x(\sigma).$$

Since  $x(\sigma_0^2)$  is 0 or  $\frac{k}{2}$ , we can make the sum on the right 0. Replacing  $\sigma_0$  by  $\sigma_0\sigma$  if necessary, we suppose that  $\sigma_0^2 = 1$ . Then  $(\sigma_0\sigma)^2 = 1$  if and only if

$$\frac{k}{2} x(\sigma) \equiv 0 \pmod{k}$$

which is so if and only if  $\sigma_0\sigma$  is conjugate to  $\sigma$ .

Take  $V$  in  $S(K/L)$  as before. If  $V$  is invariant under  $\pi^*(\sigma_0)$  and  $\lambda'$  with  $p^\ell$  elements and  $\phi'$  with  $p^f$  elements have the same meaning as before then

$$p^f = \frac{k}{2} - 1 + wk$$

for some integer  $w$  so that

$$q - 1 = p^{2f} - 1 = k \cdot \frac{k}{4} - k + 2wk \left( \frac{k}{2} - 1 \right) + (wk)^2$$

and

$$\frac{q-1}{k} \equiv \frac{k}{4} - 1 \pmod{2}$$

is odd. Thus the identities (14.5) and (14.6) are not to be considered. The identities (14.4) and (14.7) follow from Lemma 14.7 exactly as above.

Suppose then  $S(K/L)$  is the direct sum  $V \oplus \pi^*(\sigma_0)V$ . If  $V$  has  $p^\ell$  elements then  $q = p^{2\ell}$  and

$$\frac{q-1}{k} = \frac{p^\ell-1}{k} (p^\ell+1)$$

is even because  $k$  divides  $p^\ell - 1$ . The non-zero elements of  $S(K/L)$  which are fixed points of some  $\sigma_0\sigma$  with  $\sigma$  a square in  $G_0/G_1$  are the elements

$$v \oplus \pi^*(\sigma_0\sigma)v$$

with  $v \neq 0$ . There are  $(p^\ell - 1) \frac{k}{2}$  such elements and they fall into  $\frac{p^\ell-1}{2}$  orbits. The remaining

$$(p^{2\ell} - 1) - (p^\ell - 1) \frac{k}{2}$$

non-zero elements have trivial isotropy group and fall into

$$\frac{1}{2k} \{ (p^{2\ell} - 1) - (p^\ell - 1) \frac{k}{2} \}$$

orbits. Thus

$$a = \frac{p^{2\ell} - 1}{2k} + \frac{p^\ell - 1}{4}.$$

Since, as before,  $\nu_\phi(-1) = -1$  the identity (14.5) becomes

$$\nu_\phi \left( \prod_\mu \gamma_\mu \right) = (-1)^{\frac{p^\ell - 1}{4}} \quad (14.11)$$

while (14.6) becomes

$$\nu_\phi \left( \prod_\mu \gamma_\mu \right) (-1)^{\Sigma[\phi_\mu : \phi]} = (-1)^{\frac{p^\ell - 1}{4}}.$$

Again

$$\sum [\phi_\mu : \phi] \equiv \frac{p^\ell - 1}{2} \equiv 0 \pmod{2}$$

so that it is enough to prove (14.11). The identities (14.4) and (14.7) need not be considered.

If  $\lambda'$  and  $\phi'$  are defined as before and  $\phi'$  has  $p^f$  elements then  $\lambda'$  has  $p^\ell = p^{2f}$  elements so that

$$p^\ell \equiv 1 \pmod{8}$$

and  $\frac{p^\ell - 1}{4}$  is even. We may suppose that each  $\mu$  in  $T$  either has trivial isotropy group or is fixed by  $\sigma_0$ . Lemma 14.8 shows that those  $\mu$  with trivial isotropy group contribute nothing to the left side of (14.11). If  $L_0$  is the fixed field of  $\sigma_0$  and

$$N_{L_0/F} \varpi_{L_0} = \gamma_0 \varpi_F$$

the left side of  $K$  is

$$\nu_\phi(\gamma_0)^{\frac{p^\ell - 1}{2}}$$

which is 1. The truth of the identity is now clear.

We return to the general case so that  $[G : G_0]$  may be greater than 2 and  $\mu_0$  may be congruent to 1 modulo 4. Of course  $[G : G_0]$  is still even. Let

$$\lambda_0 = \lambda \left( \sigma_0^{\frac{1}{2} [G : G_0]} \right)$$

so that

$$\lambda_0 = \mu_0^{\frac{1}{2}[G:G_0]}.$$

If  $[G : G_0] > 2$  then

$$\lambda_0 \equiv 1 \pmod{4}.$$

If  $[G : G_0] = 2$  then  $\lambda_0 = \mu_0$ . Since the case that  $[G : G_0] = 2$  and  $\mu_0 \equiv -1 \pmod{4}$  is completely settled we may suppose that  $\lambda_0 \equiv 1 \pmod{4}$ . Set

$$\tau_0 = \sigma_0^{\frac{1}{2}[G:G_0]}.$$

Any element of  $G/G_1$  which does not lie in  $G_0/G_1$  and whose square is 1 is of the form  $\sigma(x)\tau_0$ . If

$$\sigma_0^{[G:G_0]} = \sigma(y_0)$$

then

$$(\sigma(x)\tau_0)^2 = \sigma((\lambda_0 + 1)x)\tau_0^2 = \sigma(y_0 + (\lambda_0 + 1)x).$$

Since  $G/G_1$  is not cyclic  $y_0$  is even. Since

$$\lambda_0 + 1 \equiv 2 \pmod{4}$$

there are exactly two solutions of the equation

$$y_0 + (\lambda_0 + 1)x \equiv 0 \pmod{k}.$$

Let  $x_0$  be one of them. Then  $x_0 + \frac{k}{2}$  is the other. We may suppose that  $k$  does not divide  $x_0$ . Set

$$\rho_0 = \sigma(x_0)\tau_0.$$

We observed before that if  $\sigma \neq 1$  belongs to  $G/G_1$  and  $\pi^*(\sigma)$  has a non-zero fixed point then some power of  $\sigma$  is of order 2 and has a non-zero fixed point. Since  $\sigma\left(\frac{k}{2}\right)$  has no non-zero fixed point this power must be  $\rho_0$  or  $\sigma\left(\frac{k}{2}\right)\rho_0$ . Since  $\sigma\left(\frac{k}{2}\right)$  lies in the center of  $G/G_1$ ,  $\sigma$  must lie in the centralizer of  $\rho_0$ .

The group

$$\left\{ 1, \sigma\left(\frac{k}{2}\right), \rho_0, \sigma\left(\frac{k}{2}\right)\rho_0 \right\}$$

is of order 4 and every element in it is of order 2 so it cannot be contained in the center of  $G/G_1$ . However it is a normal subgroup and its centralizer  $H^*$  has index 2 in  $G/G_1$ .  $G/G_1$

may be identified with  $H$ . Every element  $\sigma$  of  $H$  such that  $\pi^*(\sigma)$  has a non-zero fixed point lies in  $H^*$ .  $S(K/L)$  is the direct sum of  $V$  and  $W$  where

$$\begin{aligned} V &= \{v \mid \pi^*(\rho_0)v = v\} \\ W &= \{w \mid \pi^*(\rho_0)w = -w\}. \end{aligned}$$

If  $\sigma$  in  $H$  does not belong to  $H^*$  then  $\pi^*(\sigma)V = W$  and  $\pi^*(\sigma)W = V$ . The number of non-zero orbits of  $H$  in  $V \cup W$  is the same as the number  $a'$  of non-zero orbits of  $H^*$  in  $V$ . If  $V$  has  $p^\ell$  elements so that  $q = p^{2\ell}$  the number of non-zero orbits of  $H$  in  $V \oplus W - (V \cup W)$  is

$$a'' = \frac{(p^\ell - 1)^2}{[G : G_1]} = \frac{p^\ell - 1}{k} \cdot \frac{p^\ell - 1}{[G : G_0]}.$$

The action of  $H^*$  on  $V$  must be irreducible although it is not faithful. However the action of  $H^* \cap H_0 = H_0^*$  is faithful.

Let  $F'$  be the fixed field of  $H^*$  in  $L$  or, what is the same, of  $H^*C$  in  $K$ . Let  $C^1 \subseteq C$  be the orthogonal complement of  $V$  and let  $H^1$  be the subgroup of  $H$  which acts trivially on  $V$ .  $H^1C^1$  is a normal subgroup of  $H^*C$  and its fixed field  $K'$  is normal over  $F'$ . If  $H' = H^*/H^1$  and  $C' = C/C^1$  then  $G' = \mathfrak{G}(K'/F') = H'C'$ . Moreover  $H' \cap C' = \{1\}$  and  $H' \neq \{1\}$  because  $\sigma \left(\frac{k}{2}\right)$  does not lie in  $H^1$ . Since the action of  $H'$  on  $C'$  is faithful and irreducible  $C'$  is contained in every non-trivial normal subgroup of  $G'$ . To complete the proof of the four identities (14.4), (14.5), (14.6), and (14.7) we use induction on  $[K : F]$ .

Let  $k'$  be the order of  $H'_0$  and let  $\phi' = O_{F'}/\mathfrak{P}_{F'}$ . If  $K/F$  is replaced by  $K'/F'$  the identity (14.4) becomes

$$(-1)^{a'+1} \nu_{\phi'}(k') \nu_{\phi'}(-1)^{\frac{p^\ell-1}{2k'}+\frac{1}{2}} = 1. \quad (14.4'')$$

$T$  is to be replaced by  $T'$ , a set of representatives for the non-zero orbits of  $H'$  or  $H^*$  in  $V$ , which may be identified with the character group of  $C'$ . We may suppose that  $T'$  is a subset of  $T$ . Because  $H'_0 \neq \{1\}$  the identity (14.5) for the field  $K'/F'$  may be written as

$$\nu_{\phi'} \left( \prod_{\mu \in T'} \gamma'_\mu \right) = (-1)^{a'} \nu_{\phi'}(-1)^{\frac{p^\ell-1}{2k'}}. \quad (14.5'')$$

Of course

$$N_{F_\mu/F'}(\varpi_{F_\mu}^t) = \gamma'_\mu \varpi_{F'}^{\frac{t[F_\mu:F']}{k'}}.$$

Recall that  $t$  is odd. By Proposition IV.3 of Serre's book,  $t$  has the same significance for  $K'/F'$  as it had for  $K/F$ . The identity (14.6) may be written as

$$(-1)^{a'} \nu_{\phi'} \left( \prod_{\mu \in T'} \gamma'_\mu \right) \nu_{\phi'}(-1)^{\sum_{\mu \in T'} [\phi_\mu : \phi']} \nu_{\phi'}(-1)^{\frac{p^\ell-1}{2k'}} = 1. \quad (14.6'')$$

and (14.7) as

$$(-1)^{a'+1} \nu_{\phi'}(k') \nu_{\phi'}(-1)^{\frac{p^\ell-1}{2k'}-\frac{1}{2}} \nu_{\phi'}(-1)^{\sum_{\mu \in T'} [\phi_\mu: \phi']} = 1 \quad (14.7'')$$

Assuming (14.4''), (14.5''), (14.6''), and (14.7'') we are going to prove (14.4), (14.5), (14.6), and (14.7).

Since  $H'_0$  is isomorphic to  $H_0^*$  either  $k' = k$  or  $k' = \frac{k}{2}$ . Suppose first that  $\frac{q-1}{k}$  is odd. Then  $k' = \frac{k}{2}$  for if not

$$\frac{q-1}{k} = \left( \frac{p^\ell-1}{k} \right) (p^\ell+1)$$

would be even. Thus  $H_0 = G_0/G_1$  is not contained in  $H^*$  and  $F'/F$  is ramified so that  $\phi' = \phi$ . Since

$$\frac{q-1}{k} = \left( \frac{p^\ell-1}{k'} \right) \frac{(p^\ell+1)}{2}$$

the number  $\frac{p^\ell-1}{k'}$  is odd. To prove (14.4) we have to show that

$$(-1)^{a''} \nu_\phi(2) \nu_\phi(-1)^\delta = 1$$

if

$$\delta = \frac{p^{2\ell}-1}{2k} - \frac{p^\ell-1}{k} = \frac{p^\ell-1}{k} \left\{ \frac{p^\ell+1}{2} - 1 \right\}.$$

Since  $G_0/G_1$  is not contained in  $H^*$ ,  $\tau_0$  does not commute with  $G_0/G_1$  and the map  $\lambda$  of  $G/G_0$  into the units of  $\mathbb{Z}/k\mathbb{Z}$  is faithful. Thus

$$\lambda_0 \not\equiv 1 \pmod{k}.$$

But

$$\lambda_0 \equiv 1 \pmod{4}$$

so that  $k \geq 8$ . In general if  $k \geq 4$ , the group of units of  $\mathbb{Z}/k\mathbb{Z}$  is the product of  $\{1, -1\}$  and

$$\{\alpha \mid \alpha \equiv 1 \pmod{4}\}.$$

If

$$\alpha = 1 + 2^b x$$

with  $x$  odd and  $4 \leq 2^b \leq k$  then

$$\alpha^2 = 1 + 2^{b+1} y$$

with  $y$  odd. One shows easily by induction that the order of  $\alpha$  is  $2^{-b}k$  so that

$$\{\alpha \mid \alpha \equiv 1 \pmod{4}\}$$

is cyclic of order  $\frac{k}{4}$ . This implies in the particular case under consideration that  $[G : G_0]$  divides  $\frac{k}{4}$ . Write

$$a'' = \left( \frac{p^\ell - 1}{k'} \right) \left( \frac{p^\ell - 1}{2[G : G_0]} \right).$$

$a''$  is odd if and only if

$$2[G : G_0] = k'.$$

We consider various cases separately. As before  $\mu_0 = \lambda(\sigma_0)$ . If  $\phi$  has  $p^f$  elements then

$$\mu_0 p^f \equiv 1 \pmod{8}$$

(i)

$$\mu_0 \equiv 1 \pmod{8}.$$

Then

$$\nu_\phi(2) = \nu_\phi(-1) = 1$$

and the order of  $\mu_0$  in the units of  $\mathbb{Z}/k\mathbb{Z}$  which is equal to  $[G : G_0]$  divides  $\frac{k}{8}$ . Thus  $a''$  is even. The identity (14.4) follows.

(ii)

$$\mu_0 \equiv 3 \pmod{8}.$$

Then

$$\nu_\phi(2) = \nu_\phi(-1) = -1.$$

Since  $\mu_0 \equiv 3 \pmod{8}$  the numbers  $\mu_0$  and  $\lambda_0$  are different. Thus  $\lambda_0$  is a square and hence congruent to 1 modulo 8. Then  $k > 8$  and

$$p^\ell \equiv 1 \pmod{8}.$$

Then

$$\delta \equiv \frac{p^\ell + 1}{4} - \frac{1}{2} \equiv 0 \pmod{2}.$$

Since  $\mu_0 \neq \lambda_0$  the index  $[G : G_0]$  is not 2. Thus the order of  $\mu_0$  is at least 4 and is therefore the order of  $-\mu_0$ . Since  $-\mu_0 \equiv 5 \pmod{8}$  its order is  $\frac{k}{4}$  and

$$[G : G_0] = \frac{k}{4}.$$

Consequently  $a''$  is odd. Again (14.4) is satisfied.

(iii)

$$\mu_0 \equiv 5 \pmod{8}.$$

Then  $\nu_\phi(2) = -1$  while  $\nu_\phi(-1) = 1$ . The order of  $\mu_0$  which equals  $[G : G_0]$  is again  $\frac{k}{4}$  so that  $a''$  is odd and (14.4) is satisfied.

(iv)

$$\mu_0 \equiv 7 \pmod{8}.$$

Then  $\nu_\phi(2) = 1$  while  $\nu_\phi(-1) = -1$ . Again  $k > 8$  and

$$\delta \equiv 0 \pmod{2}.$$

The order of  $\mu_0$  is again at least 4 and therefore equal to the order of  $-\mu_0$  and that divides  $\frac{k}{8}$ . Thus  $[G : G_0]$  divides  $\frac{k}{8}$  and  $a''$  is even. (14.4) follows once more.

Since  $\phi' = \phi$  all we need to prove (14.7) once (14.4) and (14.7'') are granted is show that

$$\sum_{\mu \in T-T'} [\phi_\mu : \phi] \equiv 0 \pmod{2}.$$

This is clear because, for these  $\mu$ ,  $F_\mu = L$  and  $\phi_\mu = O_L/\mathfrak{P}_L$  is of even degree over  $\phi$ .

Finally we have to assume that  $\frac{q-1}{k}$  is even and prove (14.5) and (14.6). First a lemma.

**Lemma 14.9**

If  $\frac{q-1}{k}$  is even,

$$\lambda \left( \sigma_0^{\frac{1}{2} [G:G_0]} \right) \equiv 1 \pmod{4},$$

and  $G/G_0$  acts faithfully on  $G_0/G_1$ , then

$$(-1)^a \nu_\phi(-1)^{\frac{q-1}{2k}} = 1.$$

Since the action is faithful  $G_0/G_1$  is not contained in  $H^*$  and  $k' = \frac{k}{2}$ . As before  $\lambda_0 \equiv 1 \pmod{4}$  and  $\lambda_0 \not\equiv 1 \pmod{k}$  together imply that  $k \geq 8$  and  $k' \geq 4$ . Since  $k'$  divides  $p^\ell - 1$ ,

$$p^\ell \equiv 1 \pmod{4}$$

and  $\frac{p^\ell+1}{2}$  is odd. Since

$$\frac{q-1}{k} = \left( \frac{p^\ell-1}{k'} \right) \left( \frac{p^\ell+1}{2} \right)$$

the number  $\frac{p^\ell - 1}{k'}$  is even.

If  $\sigma$  belongs to  $H^*$  and  $\sigma$  acts trivially on  $H_0^*$  then

$$\lambda(\sigma) \equiv 1 \pmod{\frac{k}{2}}$$

so that

$$\lambda(\sigma^2) \equiv 1 \pmod{k}$$

and  $\sigma^2$  belongs to  $H_0$ . Thus  $\sigma$  belongs to  $\rho_0 H_0 \cup H_0$ . Since  $\rho_0$  belongs to  $H^1$  the image of  $\sigma$  in  $H'$  lies in  $H'_0$ . Thus  $G'/G'_0$  acts faithfully on  $G'_0/G'_1$ . If  $\sigma$  belongs to  $H^1$  then  $\sigma$  acts trivially on  $H_0^*$  because the representation of  $H_0^*$  on  $V$  is faithful. Thus  $H^1$  is contained in  $\rho_0 H_0 \cup H_0$  and is therefore just  $\{\rho_0, 1\}$ . Thus

$$[G' : G'_0] = [H' : H'_0] = [H^* : H_0^* H^1] = \frac{1}{2} [G : G_0].$$

Suppose that

$$(-1)^a \nu_{\phi'}(-1)^{\frac{p^\ell - 1}{2k'}} = 1. \quad (14.12)$$

Since  $\phi' = \phi$  and, because  $k' \geq 4$  divides  $p^\ell - 1$ ,

$$\frac{q-1}{2k} = \left( \frac{p^\ell - 1}{2k'} \right) \left( \frac{p^\ell + 1}{2} \right) \equiv \left( \frac{p^\ell - 1}{2k'} \right) \pmod{2},$$

all we need do to establish the lemma is to show that

$$a'' \equiv 0 \pmod{2}.$$

As before  $[G : G_0]$  divides  $\frac{k}{4}$ . If

$$\frac{k}{4} = n[G : G_0]$$

then

$$a'' = \frac{1}{k} \frac{(p^\ell - 1)^2}{[G : G_0]} = n \left( \frac{p^\ell - 1}{k'} \right)^2$$

is certainly even because  $2k'$  divides  $p^\ell - 1$ .

If  $[G : G_0] \geq 4$  let

$$\lambda'_0 = \lambda \left( \sigma_0^{\frac{1}{4}[G:G_0]} \right).$$

If

$$\lambda'_0 \equiv 1 \pmod{4}$$

we may suppose that (14.12) is true by induction. If  $[G : G_0] = 4$  and

$$\lambda'_0 \equiv 3 \pmod{4}$$

or if  $[G : G_0] = 2$  we must establish it directly.

Suppose first that  $[G : G_0] = 2$ . If  $\phi$  has  $p^f$  elements then

$$\lambda_0 \equiv \mu_0 \equiv p^f \equiv 1 \pmod{4}$$

so that  $\nu_\phi(-1) = 1$ . It is clear that in this case

$$a' = \frac{p^\ell - 1}{k'}.$$

$a'$  is thus even and (14.12) is valid.

Now suppose  $[G : G_0] = 4$  so that  $[G' : G'_0] = 2$ . If  $\sigma'_0$  generates  $G'$  modulo  $G'_0$  then  $\lambda'_0$  is the image of  $\sigma'_0$  in the group of units of  $\mathbb{Z}/k'\mathbb{Z}$ . We have already studied the case that  $\lambda'_0 \equiv 3 \pmod{4}$  intensively. Let

$$x : \sigma' \longrightarrow x(\sigma')$$

be the map of  $G'_0/G'_1$  onto  $\mathbb{Z}/k'\mathbb{Z}$ . If  $\lambda'_0 \equiv -1 \pmod{k'}$  and  $x((\sigma'_0)^2) = \frac{k'}{2}$  we showed, incidentally, that (14.12) is valid. If  $\lambda'_0 \equiv -1 \pmod{k'}$ ,  $x((\sigma'_0)^2) = 0$ , and the action of  $H'_0$  on  $S(K'/L')$  is reducible we saw that  $p^\ell$  is a square  $p^{2\ell'}$  and that the left side of (L) is

$$(-1)^{\frac{p^{\ell'}-1}{2}}.$$

But the field with  $p^{\ell'}$  elements must contain the  $k'$ th roots of unity and  $k' \equiv 0 \pmod{4}$ . Thus

$$p^{\ell'} - 1 \equiv 0 \pmod{4}$$

and (14.12) is again valid. If  $k' \geq 8$ ,

$$\lambda'_0 \equiv \frac{k'}{2} - 1 \pmod{k'}$$

and the action of  $H'_0$  on  $S(K'/L')$  is reducible, the left side of (14.12) is

$$(-1)^{\frac{p^{\ell'}-1}{4}}.$$

This time

$$p^{\ell'} - 1 \equiv 0 \pmod{8}.$$

To complete the proof of the lemma we show that in the case under consideration the action of  $H'_0$  and  $S(K'/L')$  or, what is the same, the action of  $H_0^*$  on  $V$  is reducible. If not the field generated over the prime field by the  $k'$ th roots of unity has  $p^\ell$  elements. Thus

$$p^\ell \equiv 1 \pmod{4}.$$

However as we have observed repeatedly, the number of elements in  $\phi$  is congruent to 3 modulo 4. Thus  $\ell$  is even. Let  $\ell = 2\ell'$ . Either  $p^{\ell'} - 1$  or  $p^{\ell'} + 1$  is congruent to 2 modulo 4. If  $p^{\ell'} + 1 \equiv 2 \pmod{4}$  then  $k'$  divides  $p^{\ell'} - 1$  because

$$\frac{p^\ell - 1}{k'} = \left( \frac{p^{\ell'} - 1}{k'} \right) (p^{\ell'} + 1)$$

is even. Since  $k'$  cannot divide  $p^{\ell'} - 1$  we have

$$p^{\ell'} \equiv 3 \pmod{4}$$

and  $\ell'$  is odd. Indeed it is 1 but that does not matter. Since  $k$  divides  $p^\ell - 1$ , the  $k$ th roots of unity are contained in the field with  $p^\ell$  elements. Adjoining them to  $\phi = O_F/\mathfrak{P}_F$  we obtain a quadratic extension because 4 does not divide  $\ell$ . Therefore if  $\sigma$  belongs to  $G_0/G_1$

$$\theta_0(\sigma) = \theta_0(\sigma)^{\sigma_0^{-2}} = \theta_0(\sigma)^{\lambda(\sigma_0^2)}$$

so that

$$\lambda(\sigma_0^2) \equiv 1 \pmod{k}.$$

This contradicts the assumption that  $G/G_0$  acts faithfully on  $G_0/G_1$ .

Returning to the proof of (14.5), we suppose first that  $H_0$  is not contained in  $H^*$  so that the action of  $G/G_0$  on  $G_0/G_1$  is faithful. Because of Lemma 14.9 the identity (14.5) is equivalent to

$$\nu_\phi \left( \prod_{\mu \in T} N_{F_\mu/F} \gamma_\mu \right) = 1.$$

If  $\mu$  belongs to  $T$  but not to  $T'$  then  $F_\mu = L$  and, by Lemma 14.8,

$$\nu_\phi(N_{F_\mu/F} \gamma_\mu) = 1.$$

If  $\mu$  belongs to  $T'$  then  $G_\mu$  is contained in  $H^*C$  so that  $F_\mu$  contains  $F'$ . Moreover we do not change  $F_\mu$  if we replace  $K/F$  by  $K'/F'$ . Let  $\varpi_{F'}$  generate  $\mathfrak{P}_{F'}$  and take  $\varpi_F = N_{F'/F}\varpi_{F'}$ . If  $E'$  is the fixed-field of  $H^*$  we may suppose that

$$\varpi_{F'} = N_{E'/F'}\varpi_{E'}$$

and that

$$\varpi_E = N_{E'/E}\varpi_{E'}.$$

Then

$$\varpi_F = N_{E/F}\varpi_E$$

as required. Let

$$N_{F_\mu/F}, \varpi_{F_\mu}^t = \gamma'_\mu \varpi^{\frac{t[F_\mu:F']}{k'}}.$$

Then

$$\gamma_\mu = N_{F'/F} \gamma'_\mu.$$

Since  $F'/F$  is ramified  $\gamma_\mu$  is a square in  $U_F$  and (14.5) is proved. To prove (14.6) we have to show that

$$\nu_\phi(-1)^{\sum_{\mu \in T} [\phi_\mu : \phi]} = \nu_{\phi'}(-1)^{\sum_{\mu \in T'} [\phi_\mu : \phi']} = 1.$$

But  $\frac{p^\ell-1}{k'}$  is even and this follows from the simultaneous validity of (14.5'') and (14.6'').

We have yet to treat the case that  $\frac{q-1}{k}$  is even and  $H_0$  is contained in  $H^*$ . Then  $F'/F$  is unramified and  $k' = k$ . Suppose first of all that  $\frac{p^\ell-1}{k}$  is also even. Then

$$\frac{q-1}{2k} = \left( \frac{p^\ell-1}{k} \right) \left( \frac{p^\ell+1}{2} \right)$$

is even.  $H_0$  is contained in  $H^*$  and  $H$  is generated by  $\sigma_0$  and  $H_0$ . Consequently  $\sigma_0$  is not contained in  $H^*$  and

$$\sigma_0 \rho_0 \sigma_0^{-1} = \sigma \left( \frac{k}{2} \right) \rho_0.$$

Since  $\rho_0 = \sigma(x_0)\tau_0$

$$(\mu_0 - 1)x_0 \equiv \frac{k}{2} \pmod{k}$$

if  $\mu_0 = \lambda(\sigma_0)$ . If

$$y_0 = x \left( \sigma_0^{[G:G_0]} \right)$$

and  $m$  is the greatest common divisor of  $y_0$  and  $k$  then by the definition of  $x_0$  the greatest common divisor of  $x_0$  and  $k$  is  $\frac{m}{2}$ . Therefore  $\frac{k}{m}$  is the greatest common divisor of  $\mu_0 - 1$  and  $k$ . In particular  $m < k$ . The order of  $\sigma_0$  in  $H$  is

$$\frac{k}{m} [G : G_0].$$

Therefore  $[G : G_0]$  divides  $\frac{k}{2m} [G : G_0]$  and  $H^*$  contains a cyclic subgroup of order

$$\frac{k}{2m} [G : G_0].$$

If  $\sigma$  is the element of order 2 in this subgroup, then  $\sigma$  belongs to  $H_0$  and  $\pi^*(\sigma)$  does not have 1 as an eigenvalue. Thus no non-zero element of  $V$  is fixed by any element of this cyclic subgroup and

$$p^\ell - 1 \equiv 0 \left( \text{mod } \frac{k}{2m} [G : G_0] \right).$$

In particular  $[G : G_0]$  divides  $p^\ell - 1$  and

$$a'' = \left( \frac{p^\ell - 1}{k} \right) \left( \frac{p^\ell - 1}{[G : G_0]} \right)$$

is even. As before  $\nu_\phi(\gamma_\mu) = 1$  if  $\mu$  belongs to  $T$  and  $F_\mu = L$ . If  $F_\mu \neq L$  then  $\mu$  belongs to  $T'$  and  $G_\mu$  lies in  $H^*C$  so that  $F_\mu$  contains  $F'$ . In the present situation  $F'/F$  is unramified and we may take  $\varpi_{F'} = \varpi_F$ . If

$$N_{F_\mu/F'} \varpi_{F_\mu}^t = \gamma'_\mu \varpi_F^{\frac{t[F_\mu:F']}{k}}$$

then

$$N_{F_\mu/F} \varpi_{F_\mu}^t = (N_{F'/F} \gamma'_\mu) \varpi_F^{\frac{t[F_\mu:F]}{k}}.$$

The identity (14.5) reduces to

$$\nu_\phi \left( \prod_{\mu \in T'} N_{F'/F} \gamma'_\mu \right) = (-1)^{a'}$$

or

$$\nu_{\phi'} \left( \prod_{\mu \in T'} \gamma'_\mu \right) = (-1)^{a'}.$$

Since  $\phi'$  is a quadratic extension of  $\phi$  the number  $\nu_{\phi'}(-1)$  is 1 and this relation is equivalent to (14.5''). To prove (14.6) we have to show that

$$\nu_\phi(-1)^{\sum_{\mu \in T} [\phi_\mu : \phi]} = 1.$$

This is clear because 2 divides each of the degrees  $[\phi_\mu : \phi]$ .

Finally we have to suppose that  $\frac{p^\ell - 1}{k}$  is odd. Since  $[\phi' : \phi] = 2$  the relation (14.4'') amounts to

$$(-1)^{a'+1} = 1.$$

Again

$$\nu_\phi \left( \prod_{\mu \in T} \gamma_\mu \right) = \nu_{\phi'} \left( \prod_{\mu \in T'} \gamma'_\mu \right). \quad (14.13)$$

If  $\mu$  belongs to  $T'$  and  $\sigma \neq 1$  belongs to  $G_\mu$  then some power of  $\sigma$  will equal  $\rho_0$ . Since

$$\frac{p^\ell - 1}{k} = \sum_{\mu \in T'} \frac{[F_\mu : F']}{k}$$

is odd and

$$\frac{[F_\mu : F']}{k}$$

is a power of 2 there is at least one  $\mu$  in  $T'$  for which  $[F_\mu : F'] = k$ . Then  $G_\mu$  must contain an element of the form  $\sigma(z_0)\sigma_0^2$ . Then

$$\rho_0 = \sigma(x_0)\tau_0 = (\sigma(z_0)\sigma_0^2)^{\frac{1}{4}[G:G_0]} = \sigma \left( \left( \frac{\mu_0^{\frac{1}{2}[G:G_0]} - 1}{\mu_0^2 - 1} \right)^{z_0} \right)^{\tau_0}.$$

Thus

$$\left( \frac{\mu_0^{\frac{1}{2}[G:G_0]} - 1}{\mu_0^2 - 1} \right) z_0 \equiv x_0 \pmod{k}.$$

Let

$$\frac{1}{4}[G : G_0] = 2^b.$$

Since

$$\mu_0^2 \equiv 1 \pmod{4}$$

and, as before, the greatest common divisor of  $x_0$  and  $k$  is  $\frac{m}{2}$  if the greatest common divisor of  $y_0$  and  $k$  is  $m$ , we infer that

$$\frac{\mu_0^{\frac{1}{2}[G:G_0]} - 1}{\mu_0^2 - 1} = \prod_{j=1}^b \frac{\mu_0^{2^{j+1}} - 1}{\mu_0^{2^j} - 1} = \prod_{j=1}^b \mu_0^{2^j} + 1$$

is multiplicatively congruent to

$$\frac{[G : G_0]}{4}$$

modulo 2 and that the greatest common divisor of  $z_0$  and  $k$  is

$$\frac{2m}{[G : G_0]}.$$

In particular  $\frac{[G:G_0]}{2}$  divides  $m$ .  $z_0$  is odd if and only if

$$m = \frac{1}{2} [G : G_0].$$

If  $\mu_0 \equiv 1 \pmod{4}$  the order of  $\mu_0$  in the group of units of  $\mathbb{Z}/k\mathbb{Z}$  is  $m$  because as we observed when treating the case that  $\frac{p^\ell-1}{k}$  is even, the greatest common divisor of  $\mu_0 - 1$  and  $k$  is  $\frac{k}{m}$ . However

$$\mu_0^{\frac{1}{2}[G:G_0]} \equiv \lambda(\tau_0) \equiv 1 \pmod{k}$$

and in this case  $m$  divides  $\frac{1}{2} [G : G_0]$ . Thus

$$m = \frac{1}{2} [G : G_0]$$

if  $\mu_0 \equiv 1 \pmod{4}$ .

We shall define a sequence of fields  $F^{(i)}, L^{(i)}, K^{(i)}$ ,  $1 \leq i \leq n$ .  $n$  is an integer to be specified. We will have  $F^{(i)} \subseteq L^{(i)} \subseteq K^{(i)}$  and  $K^{(i)}/F^{(i)}$  and  $L^{(i)}/F^{(i)}$  will be Galois. Let  $G^{(i)} = \mathfrak{G}(K^{(i)}/F^{(i)})$  and  $C^{(i)} = \mathfrak{G}(L^{(i)}/F^{(i)})$ . There will be a subgroup  $H^{(i)}$  of  $G^{(i)}$  such that  $H^{(i)} \neq \{1\}$ ,  $H^{(i)} \cap C^{(i)} = \{1\}$ , and  $G^{(i)} = H^{(i)}C^{(i)}$ .  $C^{(i)}$  will be a non-trivial abelian normal subgroup of  $G^{(i)}$  which is contained in every other non-trivial normal subgroup.  $H^{(n)}$  will be abelian but  $H^{(i)}$  will be non-abelian if  $i < n$ . Moreover  $k^{(i)} = [H_0^{(i)} : 1]$  will be at least 4 for all  $i$  and  $k^{(i)}$  will equal  $2k^{(i+1)}$  if  $i < n$ . If  $x$  is an isomorphism of  $H_0^{(i)}$  with  $\mathbb{Z}/k^{(i)}\mathbb{Z}$  and  $\sigma$  belongs to  $H^{(i)}$  let

$$x(\sigma\tau\sigma^{-1}) = \lambda^{(i)}(\sigma)x(\tau).$$

Then  $\lambda^{(i)}(\sigma)$  will be congruent to 1 modulo 8 if  $i < n$ . If  $q^{(i)}$  is the number of elements in  $C^{(i)}$  then

$$\frac{q^{(i)} - 1}{k^{(i)}}$$

will be odd.

$F'$  and  $K'$  have already been defined.  $L'$  is just the fixed field of  $C'$ .

$$\frac{q' - 1}{k'} = \frac{p^\ell - 1}{k}$$

is odd. If  $\sigma'$  in  $H'$  is the image of  $\sigma$  in  $H^*C$  then

$$\lambda'(\sigma') \equiv \lambda(\sigma) \pmod{k}.$$

Since  $\sigma$  is a square modulo  $H_0$

$$\lambda'(\sigma') \equiv 1 \pmod{k}.$$

If  $F^{(i)}$ ,  $L^{(i)}$ , and  $K^{(i)}$  have been defined and  $H^{(i)}$  is not abelian we can define  $F^{(i+1)}$ ,  $L^{(i+1)}$ ,

$K^{(i+1)}$  by the process we used to pass from  $F$ ,  $L$ ,  $K$  to  $F'$ ,  $L'$ ,  $K'$ . We have seen that if

$$\frac{q^{(i)} - 1}{k^{(i)}}$$

is odd then

$$\frac{q^{(i+1)} - 1}{k^{(i+1)}}$$

is also odd and that

$$k^{(i)} = 2k^{(i+1)}.$$

We have also seen that  $k^{(i)} \geq 8$  if  $H^{(i)}$  is not abelian. If  $H^{(i)}$  is abelian we take  $n = i$ .

When we pass from the  $i$ th stage to the  $(i+1)$ th we break up  $T^{(i)}$ , the analogue of  $T$ , into  $T^{(i+1)}$  and a complementary set  $U^{(i)}$ . We may think of  $T^{(i)}$  as lying in  $T$ . If  $\sigma_0^{(i)}$  generates  $H^{(i)}$  modulo  $H_0^{(i)}$  then

$$\lambda'(\sigma_0^{(i)}) \equiv 1 \pmod{8}.$$

We saw that this implies that  $U^{(i)}$  has an even number of elements. If  $\mu$  belongs to  $U^{(i)}$  then  $F_\mu$  is equal to  $L^{(i)}$ . Thus we may suppose that

$$\nu_{\phi'} \left( \prod_{\mu \in U^{(i)}} \gamma'_\mu \right) = 1.$$

Moreover  $L^{(i)}/F^{(i)}$  is non-abelian and therefore  $L^{(i)}/F^{(i)}$  is not totally ramified. Thus  $\mu$  is not in  $U^{(i)}$  if  $[F_\mu : F'] = k$ .

Since  $L^{(n)}/F^{(n)}$  is abelian the isotropy group in  $H^{(n)}$  of any  $\mu$  in  $T^{(n)}$  is trivial so that  $F_\mu = L^{(n)}$  for such  $\mu$ . Since

$$\sum_{\mu \in T'} \frac{[F_\mu : F']}{k} \equiv \sum_{\mu \in T^{(n)}} \frac{[L^{(n)} : F']}{k} \pmod{2}.$$

There are an odd number of elements in  $T^{(n)}$  and

$$[L^{(n)} : F'] = k.$$

Choose  $z_0$  so that  $\sigma(z_0)\sigma_0^2$  lies in  $\mathfrak{G}(L/L^{(n)})$ . It then fixes each  $\mu$  in  $T^{(n)}$ .

Since  $L^{(n)}/F'$  must be totally ramified there is a  $\delta$  in  $U_F$  such that

$$N_{L^{(n)}/F} \varpi_{L^{(n)}} = \delta \varpi_F^2.$$

The right side of (14.13) is equal to  $\nu_\phi(\delta)$ .  $L^{(n)}$  is contained in  $L$ . Choose  $w_0$  in  $W_{L/F}$  so that  $\tau_{L/F}(w_0) = \varpi_F$ . We may suppose that  $\sigma_0$  has been chosen to be  $\sigma(w_0)$ . Let  $L_0$  be the fixed field of  $H_0$ . Choose  $u_0$  in  $W_{L/L_0}$  so that  $\sigma(u_0) = \sigma(z_0)$  and so that  $\tau_{L/L_0}(u_0)$  is a unit. Clearly  $z_0$  is even if and only if  $\tau_{L/L_0}(u_0)$  or

$$N_{L_0/F}(\tau_{L/L_0}(u_0)) = \tau_{L/F}(u_0)$$

is a square. Since  $\sigma(z_0)\sigma_0^2$  lies in  $\mathfrak{G}(L/L^{(n)})$ ,

$$u_0 w_0^2$$

lies in  $W_{L/L^{(n)}}$ . We may take

$$\varpi_{L^{(n)}} = \tau_{L/L^{(n)}}(u_0 w_0^2).$$

Then

$$N_{L^{(n)}/F}(\varpi_{L^{(n)}}) = \tau_{L/F}(u_0 w_0^2) = \tau_{L/F} \varpi_F^2$$

and  $\delta = \tau_{L/F}(u_0)$  is a square if and only if  $z_0$  is even.

Since  $(-1)^{a'+1} = 1$  the relation (14.5) amounts to

$$(1)^{a''-1} \nu_\phi(-1)^{\frac{q-1}{2k}} = (-1)^{z_0}.$$

(14.6) is equivalent to (14.5) because each  $[\phi_\mu : \phi] = 2[\phi_\mu : \phi']$  is even. Recall that

$$a'' = \left( \frac{p^\ell - 1}{k} \right) \left( \frac{p^\ell - 1}{[G : G_0]} \right) \equiv \frac{p^\ell - 1}{[G : G_0]} \pmod{2}$$

and that

$$\frac{q-1}{2k} = \left( \frac{p^\ell - 1}{k} \right) \left( \frac{p^\ell + 1}{2} \right) \equiv \frac{p^\ell + 1}{2} \pmod{2}.$$

If

$$\mu_0 \equiv 1 \pmod{4}$$

then  $\nu_\phi(-1) = 1$  and, as we observed earlier,  $z_0$  is odd. We have to show that  $a''$  is even. We showed before that  $H^*$  has to contain a cyclic subgroup of order  $\frac{k}{2m} [G : G_0]$  and that  $\frac{k}{2m} [G : G_0]$  has to divide  $p^\ell - 1$ . But  $\frac{k}{m}$  is the greatest common divisor of  $\mu_0 - 1$  and  $k$ . Since 4 divides  $\mu_0 - 1$  and  $k$  it divides  $\frac{k}{m}$  and  $2[G : G_0]$  divides  $p^\ell - 1$ . Thus  $a''$  is even.

If

$$\mu_0 \equiv 3 \pmod{4}$$

then  $\nu_\phi(-1) = -1$ . Moreover  $k > 2$  so that  $p^\ell \equiv 1 \pmod{4}$  and

$$\frac{q-1}{2k} \equiv \frac{p^\ell + 1}{2} \equiv 1 \pmod{2}.$$

We have to show that  $a''$  is odd if

$$m = \frac{1}{2} [G : G_0]$$

and even otherwise. But  $\mu_0 \equiv 3 \pmod{4}$  so that  $\frac{k}{m} = 2$  and  $m = \frac{k}{2}$ . Thus  $[G : G_0] = 2m$  if and only if  $[G : G_0] = k$ . If  $[G : G_0] = k$  then

$$a'' \equiv \frac{p^\ell - 1}{k} \pmod{2}$$

is odd. Otherwise  $2[G : G_0]$  divides  $k$  and  $a''$  is even.

Lemma 14.3 is now completely proved, so we turn to Lemma 14.4. In the proof of both Lemma 14.4 and 14.5, we will combine the induction assumption with Lemma 15.1 which is stated and proved in paragraph 15, the following paragraph. Suppose  $F \subseteq F' \subseteq L$  and  $F'/F$  is cyclic of prime degree  $\ell$ . Let  $\mathfrak{G}(K/F')$  be  $H'C$  where  $H' \subseteq H$  and let  $E'$  be the fixed field of  $H'$ . Then  $E'/E$  is cyclic of prime order  $\ell$ . If  $S(F'/F)$  is the set of characters of  $C_F/N_{F'/F}C_{F'}$  then

$$S(E'/E) = \{\nu_{E/F} \mid \nu_F \in S(F'/F)\}.$$

From Lemma 15.1 we see that for any quasi-character  $\chi_F$ ,

$$\text{Ind}(W_{K/E}, W_{K/E'}, \chi_{E'/E}) \simeq \bigoplus_{\nu_F \in S(F'/F)} \nu_{E/F} \chi_{E/F}.$$

Therefore

$$\text{Ind}(W_{K/F}, W_{K/E'}, \chi_{E'/E}) \simeq \bigoplus_{\nu_F} \text{Ind}(W_{K/F}, W_{K/E}, \nu_{E/F} \chi_{E/F})$$

which is equivalent to

$$\oplus_{\nu_F} \{ (\oplus_{\mu \in T} \text{Ind}(W_{K/F}, W_{K/F_\mu}, \mu' \nu_{F_\mu/F} \chi_{F_\mu/F})) \oplus \nu_F \chi_F \}.$$

If  $T'$  is a set of representatives for the non-trivial orbits of  $H'$  in  $S(K/L)$  then

$$\text{Ind}(W_{K/F'}, W_{K/E'}, \chi_{E'/F}) = \sigma$$

is equivalent to

$$(\oplus_{\mu \in T'} \text{Ind}(W_{K/F'}, W_{K/F'_\mu}, \mu' \chi_{F'_\mu/F})) \oplus \chi_{F'/F}.$$

Moreover

$$\text{Ind}(W_{K/F}, W_{K/F'}, \sigma) \simeq \text{Ind}(W_{K/F}, W_{K/E'}, \chi_{E'/E}).$$

Applying the induction assumption to  $L/F$  we see that

$$\left\{ \prod_{\nu_F} \Delta(\nu_F, \chi_F, \psi_F) \right\} \left\{ \prod_{\nu_F} \prod_{\mu \in T} \Delta(\mu' \nu_{F_\mu/F} \chi_{F_\mu/F}, \psi_{F_\mu/F}) \lambda(F/F, \psi_F) \right\}$$

is equal to

$$\{ \Delta(\chi_{F'/F}, \psi_{F'/F}) \lambda(F'/F, \psi_F) \} \left\{ \prod_{\mu \in T'} \Delta(\mu' \chi_{F'_\mu/F}, \psi_{F'_\mu/F}) \lambda(F'_\mu/F, \psi_F) \right\}. \quad (14.14)$$

The application is legitimate because the fields  $F'$ ,  $F_\mu$ , and  $F'_\mu$  all lie between  $F$  and  $L$ . By Lemma 4.5

$$\lambda(F'_\mu/F, \psi_F) = \lambda(F'_\mu/F', \psi_{F'/F}) \lambda(F'/F, \psi_F)^{[F'_\mu:F']}.$$

Also

$$\lambda(F'/F, \psi_F) \left\{ \prod_{\mu \in T'} \lambda(F'_\mu/F, \psi_F)^{[F'_\mu:F']} \right\} = \lambda(F'/F, \psi_F)^{[E':F']}.$$

Since the fields  $F'$  and  $F'_\mu$  lie between  $F'$  and  $K$  we can apply the induction assumption to  $K/F'$  to see that (14.14) is equal to the product of

$$\lambda(F'/F, \psi_F)^{[E':F']}$$

and

$$\Delta(\chi_{E'/F}, \psi_{E'/F}) \lambda(E'/F', \psi_{F'/F}).$$

Applying the induction assumption to  $K/E$  we see that

$$\Delta(\chi_{E'/F}, \psi_{E'/F})$$

is equal to

$$\left\{ \prod_{\nu_F \in S(F'/F)} \Delta(\nu_{E/F} \chi_{E/F}, \psi_{E/F}) \right\} \lambda(E'/E, \psi_{E/F})^{-1}.$$

We conclude that the quotient

$$\prod_{\nu_F} \left\{ \frac{\Delta(\nu_F \chi_F, \psi_F) \prod_{\mu \in T} \Delta(\mu' \nu_{F_\mu/F} \chi_{F_\mu/F}, \psi_{F_\mu/F})}{\Delta(\nu_{E/F} \chi_{E/F}, \psi_{E/F})} \right\} \quad (14.15)$$

is independent of  $\chi_F$ . Taking  $\chi_F$  to be trivial we see that it equals

$$\prod_{\nu_F} \left\{ \frac{\Delta(\nu_F, \psi_F) \prod_{\mu \in T} \Delta(\mu' \nu_{F_\mu/F}, \psi_{F_\mu/F})}{\Delta(\nu_{E/F}, \psi_{E/F})} \right\}. \quad (14.16)$$

It is easily seen that the complex conjugate of  $\Delta(\nu_F, \psi_F)$  is

$$\nu_F(-1) \Delta(\nu_F^{-1}, \psi_F).$$

Thus

$$\Delta(\nu_F, \psi_F) \Delta(\nu_F^{-1}, \psi_F) = \nu_F(-1).$$

If  $\ell$  is odd the right side is 1. Since

$$\Delta(1, \psi_F) = 1$$

and  $\nu_F \neq \nu_F^{-1}$  if  $\ell$  is odd, the product

$$\prod_{\nu_F \in S(L/F)} \Delta(\nu_F, \psi_F) = 1.$$

For the same reasons

$$\prod_{\nu_F \in S(L/F)} \Delta(\nu_{E/F}, \psi_{E/F}) = 1.$$

However, if  $\ell$  is 2

$$\Delta(\nu_F, \psi_F) = \Delta(\nu_F^{-1}, \psi_F)$$

has square  $\pm 1$  and is therefore a fourth root of unity. Thus

$$\prod_{\nu \in S(L/F)} \Delta(\nu_F, \psi_F) \sim \prod_{\nu \in S(L/F)} \Delta(\nu_{E/F}, \psi_{E/F}) \sim_2 1.$$

On the other hand,  $m(\mu') = t + 1 \geq 2$  while  $m(\nu_{F_\mu/F}) \leq 1$ . Thus Lemma 9.5 shows that

$$\Delta(\mu' \nu_{F_\mu/F}, \psi_{F_\mu/F}) \sim_\ell \Delta(\mu', \psi_{F_\mu/F}).$$

Thus the expression (14.16) and therefore the expression (14.15) is equal to

$$\eta \left\{ \prod_{\mu \in T} \Delta(\mu', \psi_{F_\mu/F}) \right\}^\ell$$

where  $\eta \sim_\ell 1$ .

If  $m(\chi_F)$  is 0 or 1, Lemma 14.4 is a consequence of Lemma 14.2. We suppose therefore that  $m(\chi_F) \geq 2$ . In this case Lemma 9.5 implies that

$$\prod_{\nu_F} \Delta(\nu_F \chi_F, \psi_F) \sim_\ell \Delta(\chi_F, \psi_F)^\ell$$

and that

$$\prod_{\nu_F} \Delta(\nu_{E/F} \chi_{E/F}, \psi_{E/F}) \sim_\ell \Delta(\chi_{E/F}, \psi_{E/F})^\ell.$$

We also saw in the beginning of the paragraph that, in all cases,  $m(\mu' \chi_{F_\mu/F}) \geq 2$ . Thus

$$\Delta(\mu' \nu_{F_\mu/F} \chi_{F_\mu/F}, \psi_{F_\mu/F}) \sim_\ell \Delta(\mu' \chi_{F_\mu/F}, \psi_{F_\mu/F}).$$

Putting these facts together we see that if

$$\sigma \left\{ \Delta(\chi_F, \psi_F) \prod_{\mu \in T} \Delta(\mu' \chi_{F_\mu/F}, \psi_{F_\mu/F}) \right\}^\ell$$

is equal to

$$\left\{ \Delta(\chi_{E/F}, \psi_{E/F}) \prod_{\mu \in T} \Delta(\mu', \psi_{F_\mu/F}) \right\}^\ell$$

then  $\sigma \sim_\ell 1$ . Since  $\sigma = \rho^\ell$  we conclude that

$$\rho \sim_\ell 1.$$

Finally we have to prove Lemma 14.5. Let  $F'$  be the fixed field of  $H_1 C$  and let  $L'$  be the fixed field of  $H_2 C$ . Let  $E'$  be the fixed field of  $H_1$  and let  $K'$  be the fixed field of  $H_2$ . Let  $P$  be a set of representatives for the orbits under  $\mathfrak{G}(L/F)$  of the characters in  $S(L/L')$ . If  $\nu$  is one of these representatives, let  $H_\nu H_2 C$  with  $H_\nu$  and  $H_1$  be its isotropy group and let  $F_\nu$  be the fixed field of  $H_\nu H_2 C$ . Applying the induction assumption and Lemma 15.1 to the extension  $L/F$  we see that

$$\Delta(\chi_{F'/F}, \psi_{F'/F}) \rho(F'/F, \psi_F)$$

is equal to

$$\prod_{\nu \in P} \Delta(\nu' \chi_{F_\nu/F}, \psi_{F_\nu/F}) \lambda(F_\nu/F, \psi_F). \quad (14.17)$$

Let

$$R = \{\nu \in P \mid F_\nu = F\}$$

and let  $S$  be the complement of  $R$  in  $P$ .  $R$  consists of the elements of  $S(L/L')$  fixed by each element of  $\mathfrak{G}(L/F)$ . It is a subgroup of  $S(L/L')$  and its order  $r$  must therefore be a power of  $\ell$ . The expression (14.17) may be written as

$$\left\{ \prod_{\nu \in R} \Delta(\nu' \chi_F, \psi_F) \right\} \left\{ \prod_{\nu \in S} \Delta(\nu' \chi_{F_\nu/F}, \psi_{F_\nu/F}) \lambda(F_\nu/F, \psi_F) \right\}.$$

If  $F$  is replaced by  $E$  and  $F'$  by  $E'$  then  $P$  is replaced by

$$\{\nu_{K'/L'} \mid \nu = \nu_{L'} \in P\}.$$

Also  $F_\nu$  is replaced by  $E_\nu$ , the fixed field of  $H_\nu H_2$ , and  $\nu'$  is replaced by  $\nu'_{E_\nu/F_\nu}$ . Applying the induction assumption to  $K/E$  we see that

$$\Delta(\chi_{E'/F}, \psi_{E'/F}) \lambda(E'/E, \psi_{E/F})$$

is equal to the product of

$$\left\{ \prod_{\nu \in R} \Delta(\nu'_{E/F} \chi_{E/F}, \psi_{E/F}) \right\}$$

and

$$\left\{ \prod_{\nu \in S} \Delta(\nu'_{E_\nu/F_\nu} \chi_{E_\nu/F_\nu}, \psi_{E_\nu/F}) \lambda(E_\nu/E, \psi_{E/F}) \right\}.$$

This equality will be referred to as relation (14.18).

To derive this equality we have used not only the induction assumption but also Lemma 15.1 which implies that

$$\text{Ind}(W_{K/E}, W_{K/E'}, \chi_{E'/F})$$

is equivalent to

$$\{\oplus_R \text{Ind}(W_{K/E}, W_{K/E}, \nu'_{E/F} \chi_{E/F})\} \oplus \{\oplus_S \text{Ind}(W_{K/E}, W_{K/E_\nu}, \nu'_{E_\nu/F_\nu} \chi_{E_\nu/F})\}.$$

Thus

$$\text{Ind}(W_{K/F}, W_{K/E'}, \chi_{E'/F})$$

will be equivalent to the direct sum of

$$\oplus_R \text{Ind}(W_{K/F}, W_{K/E}, \nu'_{E/F} \chi_{E/F})$$

and

$$\oplus_S \text{Ind}(W_{K/F}, W_{K/E_\nu}, \nu'_{E_\nu/F_\nu} \chi_{E_\nu/F}).$$

If  $\nu$  is in  $R$  we can apply Lemma 15.1 to see that

$$\text{Ind}(W_{K/F}, W_{K/E}, \nu'_{E/F} \chi_{E/F})$$

is equivalent to

$$\{\oplus_{\mu \in T} \text{Ind}(W_{K/F}, W_{K/F_\mu}, \mu' \nu'_{F_\mu/F} \chi_{F_\mu/F})\} \oplus \nu' \chi_F.$$

We can obtain

$$\text{Ind}(W_{K/F}, W_{K/F_\nu}, \nu'_{E_\nu/F_\nu} \chi_{E_\nu/F})$$

by first inducing from  $W_{K/E_\nu}$  to  $W_{K/F_\nu}$  and then from  $W_{K/F_\nu}$  to  $W_{K/F}$ .

If  $T_\nu$  is a set of representatives for the orbits of  $S(K/L)$  under the action of  $\mathfrak{G}(K/F_\nu)$  and  $F_{\nu,\mu}$  is the fixed field of the isotropy group of  $\mu$  in  $T_\nu$  then, by Lemma 15.1 again,

$$\text{Ind}(W_{K/F_\nu}, W_{K/E_\nu}, \nu'_{E_\nu/F_\nu} \chi_{E_\nu/F})$$

is equivalent to

$$\oplus_{T_\nu} \text{Ind}(W_{K/F_\nu}, W_{K/F_{\nu,\mu}}, \mu' \nu'_{F_{\nu,\mu}/F_\nu} \chi_{F_{\nu,\mu}/F}).$$

Since  $[K : F_\nu] < [K : F]$  if  $\nu$  belongs to  $S$ , we can apply the induction assumption to see that

$$\Delta(\nu'_{E_\nu/F_\nu} \chi_{E_\nu/F}, \psi_{E_\nu/F}) \lambda(E_\nu/F_\nu, \psi_{F_\nu/F})$$

is equal to

$$\prod_{\mu \in T_\nu} \Delta(\mu' \nu'_{F_{\nu,\mu}/F_\nu} \chi_{F_{\nu,\mu}/F}, \psi_{F_\nu/F}) \lambda(F_{\nu,\mu}/F_\nu, \psi_{F_\nu/F}).$$

This equality will be referred to as relation (14.19).

It also follows that

$$\text{Ind}(W_{K/F}, W_{K/E_\nu}, \nu'_{E_\nu/F_\nu} \chi_{E_\nu/F})$$

is equivalent to

$$\oplus_{\mu \in T_\nu} \text{Ind}(W_{K/F}, W_{K/F_{\nu,\mu}}, \mu' \nu'_{F_{\nu,\mu}/F_\nu} \chi_{F_{\nu,\mu}/F}).$$

The fields  $F_\nu$  and  $F_{\nu,\mu}$  all lie between  $F$  and  $L$ . Thus we have expressed

$$\text{Ind}(W_{K/F}, W_{K/E'}, \chi_{E'/F}) \quad (14.20)$$

as a direct sum of terms of the form

$$\text{Ind}(W_{K/F}, W_{K/M}, \chi_M) \quad (14.21)$$

where  $M$  lies between  $F$  and  $L$ . Moreover such a representation is in fact a representation of  $W_{K/F}$  obtained by inflating a representation of  $W_{L/F}$ , namely, by inflating

$$\text{Ind}(W_{L/F}, W_{L/M}, \chi_M).$$

Thus any other expression of (14.20) as a sum of representations of the form (14.21) will lead, by an application of the induction assumption to  $L/F$ , to an identity between the numbers  $\Delta(\chi_M, \psi_{M/F})$ .

To obtain another such expression, we observe that the representation (14.20) can be obtained by first inducing from  $W_{K/E'}$  to  $W_{K/F'}$  and then from  $W_{K/F'}$  to  $W_{K/F}$ . If  $T'$  is a set of representatives for the orbits of non-trivial characters in  $S(K/L)$  under the action of  $\mathfrak{G}(K/F')$  and  $F'_\mu$  is the fixed field of the isotropy group in  $\mathfrak{G}(K/F')$  of  $\mu$  in  $T'$  then

$$\text{Ind}(W_{K/F'}, W_{K/E'}, \chi_{E'/F})$$

is equivalent to

$$\{\oplus_{\mu \in T'} \text{Ind}(W_{K/F'}, W_{K/F'_\mu}, \mu' \chi_{F'_\mu/F})\} \oplus \chi_{F'/F}.$$

Thus (14.20) is equivalent to the direct sum of

$$\text{Ind}(W_{K/F}, W_{K/F'}, \chi_{F'/F})$$

and

$$\oplus_{\mu \in T'} \text{Ind}(W_{K/F}, W_{K/F'_\mu}, \mu' \chi_{F'_\mu/F}).$$

We shall describe the resultant identity in a moment. We first apply the induction assumption to the extension  $K/F'$  to see that

$$\Delta(\chi_{E'/F}, \psi_{E'/F}) \lambda(E'/F', \psi_{F'/F})$$

is equal to

$$\Delta(\chi_{F'/F}, \psi_{F'/F}) \prod_{\mu \in T'} \Delta(\mu' \chi_{F'_\mu/F}, \psi_{F'_\mu/F}) \lambda(F'_\mu/F', \psi_{F'/F}).$$

This equality will be relation (14.22).

The two expressions for the representation (14.20) lead to the conclusion that the product of

$$\prod_{\nu \in R} \Delta(\nu' \chi_F, \psi_F) \quad (14.23)$$

and

$$\prod_{\nu \in R} \prod_{\mu \in T} \Delta(\mu' \nu'_{F_\mu/F} \chi_{F_\mu/F}, \psi_{F_\mu/F}) \lambda(F_\mu/F, \psi_F) \quad (14.24)$$

and

$$\prod_{\nu \in S} \prod_{\mu \in T_\nu} \Delta(\mu' \nu'_{F_{\nu,\mu}/F_\nu} \chi_{F_{\nu,\mu}/F}, \psi_{F_{\nu,\mu}/F}) \lambda(F_{\nu,\mu}/F, \psi_F) \quad (14.25)$$

is equal to the product of

$$\Delta(\chi_{F'/F}, \psi_{F'/F}) \lambda(F'/F, \psi_F)$$

and

$$\prod_{\mu \in T'} \Delta(\mu' \chi_{F'_\mu/F}, \psi_{F'_\mu/F}) \lambda(F'_\mu/F, \psi_F).$$

Applying relation (14.22) and Lemma 4.5 we see that the second of these two products is equal to

$$\Delta(\chi_{E'/F}, \psi_{E'/F}) \lambda(E'/F', \psi_{F'/F}) \lambda(F'/F, \psi_F)^{[E':F']}.$$

According to the relation (14.18) this expression is the product of

$$\left\{ \prod_{\nu \in R} \Delta(\nu'_{E/F} \chi_{E/F}, \psi_{E/F}) \right\} \left\{ \prod_{\nu \in S} \Delta(\nu'_{E/F} \chi_{E/F}, \psi_{E/F}) \right\}$$

and

$$\prod_{\nu \in S} \lambda(E_\nu/E, \psi_{E/F})$$

and

$$\lambda(E'/E, \psi_{E/F})^{-1} \lambda(E'/F', \psi_{F'/F}) \lambda(F'/F, \psi_F)^{[E':F']}. \quad (14.26)$$

Equating this final product to the product of (14.23), (14.24), and (14.25) and then making certain cancellations by means of (14.19), we see that the product of (14.23) and (14.24) and

$$\prod_{\nu \in S} \prod_{\mu \in T_\nu} \lambda^{-1}(F_{\nu,\mu}/F_\nu, \psi_{F_\nu/F}) \lambda(F_{\nu,\mu}/F, \psi_F)$$

is equal to the product of

$$\prod_{\nu \in R} \Delta(\nu'_{E/F} \chi_{E/F}, \psi_{E/F})$$

and

$$\prod_{\nu \in S} \lambda^{-1}(E_\nu/F_\nu, \psi_{F_\nu/F}) \lambda(E_\nu/E, \psi_{E/F})$$

and the expression (14.26).

In particular, the expression

$$\prod_{\nu \in R} \left\{ \frac{\Delta(\nu' \chi_F, \psi_F) \prod_{\mu \in T} \Delta(\mu' \nu'_{F_\mu/F} \chi_{F_\mu/F}, \psi_{F_\mu/F})}{\Delta(\nu'_{E/F} \chi_{E/F}, \psi_{E/F})} \right\}$$

is independent of  $\chi_F$ . Taking  $\chi_F$  to be trivial we see that

$$\prod_{\nu \in R} \left\{ \frac{\Delta(\nu' \chi_F, \psi_F) \prod_{\mu \in T} \Delta(\mu' \nu'_{F_\mu/F} \chi_{F_\mu/F}, \psi_{F_\mu/F})}{\Delta(\nu'_{E/F} \chi_{E/F}, \psi_{E/F}) \prod_{\mu \in T} \Delta(\mu' \nu'_{F_\mu/F}, \psi_{F_\mu/F})} \right\}$$

is equal to

$$\prod_{\nu \in R} \frac{\Delta(\nu', \psi_F)}{\Delta(\nu'_{E/F}, \psi_{E/F})}.$$

The set

$$R' = \{\nu' \mid \nu \in R\}$$

is a group of characters of  $C_F$  or of  $H$ . Regarded as characters of  $H$  the elements of  $R'$  are just those characters which are trivial on  $H_1$ . As a group  $R'$  is cyclic and its order is a power of  $\ell$ . The argument used in the proof of Lemma 14.4 shows that

$$\prod_{\nu \in R} \Delta(\nu', \psi_F) \sim_\ell 1$$

and

$$\prod_{\nu \in R} \Delta(\nu'_{E/F}, \psi_{E/F}) \sim_\ell 1.$$

If  $m(\chi_F)$  is 0 or 1, Lemma 14.5 is a consequence of Lemma 14.2. We may as well suppose therefore that  $m(\chi_F) > 1$ . If  $\nu$  belongs to  $R$  then  $\nu'$  is 1 on  $N_{L/F}C_L$ . Therefore  $m(\nu')$ , as well as  $m(\nu'_{F_\mu/F})$  and  $m(\nu'_{E/F})$  is at most 1. We saw in the beginning of this paragraph that  $m(\chi_{E/F})$  would also be at least 2. We also saw that  $m(\mu' \chi_{F_\mu/F})$  would be either  $t+1$  or

$\psi_{F_\mu/F}(m-1)+1$ . In any case it is at least 2. Also  $m(\mu') = t+1$  is at least 2. Lemma 9.5 therefore implies the following relations:

$$\begin{aligned}\Delta(\nu'\chi_F, \psi_F) &\sim_\ell \Delta(\chi_F, \psi_F) \\ \Delta(\nu'_{E/F}\chi_{E/F}, \psi_{E/F}) &\sim_\ell \Delta(\chi_{E/F}, \psi_{E/F}) \\ \Delta(\mu'\nu'_{F_\mu/F}\chi_{F_\mu/F}, \psi_{F_\mu/F}) &\sim_\ell \Delta(\mu'\chi_{F_\mu/F}, \psi_{F_\mu/F}) \\ \Delta(\mu'\nu'_{F_\mu/F}, \psi_{F_\mu/F}) &\sim_\ell \Delta(\mu', \psi_{F_\mu/F}).\end{aligned}$$

We conclude finally that

$$\left\{ \frac{\Delta(\chi_F, \psi_F) \prod_{\mu \in T} \Delta(\mu'\chi_{F_\mu/F}, \psi_{F_\mu/F})}{\Delta(\chi_{E/F}, \psi_{E/F}) \prod_{\mu \in T} \Delta(\mu', \psi_{F_\mu/F})} \right\}^r \sim_\ell 1$$

if  $r$  is the number of elements in  $R$ . The lemma follows.

## Chapter Fifteen.

### Another Lemma

Suppose  $K/F$  is normal and  $G = \mathfrak{G}(K/F)$ . Suppose  $H$  is a subgroup of  $G$  and  $C$  is an abelian normal subgroup of  $G$ . Let  $E$  be the fixed field of  $H$  and  $L$  that of  $C$ . If  $\mu$  is a character of  $C$  and  $h$  belongs to  $H$ , define  $\mu^h$  by

$$\mu^h(c) = \mu(hch^{-1}).$$

The set of characters of  $C$  may be identified with  $S(K/L)$ . If  $\alpha$  belongs to  $C_L$

$$\mu^h(\alpha) = \mu(h(\alpha)).$$

The set of elements in  $S(K/L)$  which are trivial on  $H \cap C$  is invariant under  $H$ . Let  $T$  be a set of representatives for the orbits of  $H$  in this set. If  $\mu \in T$  let  $H_\mu$  be the isotropy group of  $\mu$ , let  $G_\mu = H_\mu C$  and let  $F_\mu$  be the fixed field of  $G_\mu$ . Define a character  $\mu'$  of  $G_\mu$  by

$$\mu'(hc) = \mu(c)$$

if  $h \in H_\mu$  and  $c \in C$ .  $\mu'$  may be regarded as a character of  $C_{F_\mu}$ .

### Lemma 15.1

*If  $\chi_F$  is a quasi-character of  $C_F$  then*

$$\rho = \text{Ind}(W_{K/F}, W_{K/E}, \chi_{E/F})$$

*is equivalent to*

$$\bigoplus_{\mu \in T} \text{Ind}(W_{K/F}, W_{K/F_\mu}, \mu' \chi_{F_\mu/F}).$$

Let  $G' = HC$  and let  $F'$  be the fixed field of  $G'$ .  $F'$  is contained in  $E$  and in the fields  $F_\mu$ . Because of the transitivity of the induction process it is enough to show that

$$\text{Ind}(W_{K/F'}, W_{K/E}, \chi_{E/F})$$

*is equivalent to*

$$\bigoplus_{\mu \in T} \text{Ind}(W_{K/F'}, W_{K/F_\mu}, \mu' \chi_{F_\mu/F}).$$

If

$$\chi'_{F'} = \chi_{F'/F}$$

then

$$\chi_{E/F} = \chi'_{E/F'}$$

and

$$\chi_{F_\mu/F} = \chi'_{F_\mu/F'}.$$

Consequently we may suppose, with no loss of generality, that  $F'$  is  $F$ .

If  $K'$  is the fixed field of  $H \cap C$  and  $\nu \in S(K'/L)$  let  $\varphi_\nu$  be the function on  $W_{K/F}$  defined by

$$\varphi_\nu(hc) = \chi_F(\tau_{K/F}(hc)) \nu(\tau_{K/L}(c))$$

for  $h$  in  $W_{K/E}$ ,  $c$  in  $W_{K/L}$ .  $\rho$  acts on the space of all functions  $\varphi$  on  $W_{K/F}$  satisfying

$$\varphi(hg) = \chi_F(\tau_{K/F}(h)) \varphi(g)$$

for all  $h$  in  $W_{K/E}$  and all  $g$  in  $W_{K/F}$ . The set

$$\{\varphi_\nu \mid \nu \in S(K'/L)\}$$

is a basis for this space. Clearly

$$\rho(c)\varphi_\nu = \chi_F(\tau_{K/F}(c)) \nu(\tau_{K/L}(c))\varphi_\nu$$

if  $c$  belongs to  $W_{K/L}$  and

$$\rho(h)\varphi_\nu = \chi_F(\tau_{K/F}(h))\varphi_{\nu'},$$

with  $\nu' = \nu^{h^{-1}}$ , if  $h$  belongs to  $W_{K/E}$ . Thus if  $R$  is an orbit of  $H$  in  $S(K'/L)$

$$\oplus_{\nu \in R} \mathbb{C}\varphi_\nu = V$$

is an invariant subspace.

Let  $\mu$  be the element common to  $T$  and  $R$  and consider

$$\sigma = \text{Ind}(W_{K/F}, W_{K/F_\mu}, \mu' \chi_{F_\mu/F}).$$

If  $W_{K/F}$  is the disjoint union

$$\bigcup_{i=1}^r W_{K/F_\mu} h_i$$

and if  $\varphi_i(w) = 0$  unless

$$w \in W_{K/F_\mu} h_i$$

while

$$\varphi_i(w h_i) = \mu' \chi_{F_\mu/F}(\tau_{K/F_\mu}(w))$$

for  $w$  in  $W_{K/F_\mu}$  then

$$\{\varphi_i \mid 1 \leq i \leq r\}$$

is a basis for the space  $U$  on which  $\sigma$  acts. If  $\nu_i = \mu^{h_i}$  and if  $\lambda$  is the map from  $U$  to  $V$  which sends  $\varphi_i$  to  $\chi_F^{-1}(\tau_{K/F}(h_i))\varphi_{\nu_i}$  then, as one verifies easily,

$$\lambda\sigma(w) = \rho(w)\lambda$$

for all  $w$  in  $W_{K/F}$ . The lemma follows.

The lemma has a corollary.

**Lemma 15.2**

*If Theorem 2.1 is valid for  $K/F$  then*

$$\Delta(\chi_{E/F}, \psi_{E/F}) \prod_{\mu \in T} \Delta(\mu', \psi_{F_\mu/F})$$

*is equal to*

$$\prod_{\mu \in T} \Delta(\mu' \chi_{F_\mu/F}, \psi_{F_\mu/F}).$$

If Theorem 2.1 is valid

$$\Delta(\chi_{E/F}, \psi_{E/F}) \lambda(E/F, \psi_F)$$

is equal to

$$\prod_{\mu \in T} \Delta(\mu' \chi_{F_\mu/F}, \psi_{F_\mu/F}) \lambda(F_\mu/F, \psi_F).$$

Taking  $\chi_F = 1$ , we see that

$$\lambda(E/F, \psi_F) = \prod_{\mu \in T} \Delta(\mu', \psi_{F_\mu/F}) \lambda(F_\mu/F, \psi_F).$$

Substituting this into the first equality and cancelling the non-zero factor

$$\prod_{\mu \in T} \lambda(F_\mu/F, \psi_F)$$

we obtain the lemma.

To define the  $\lambda$ -function we shall need the following lemma.

**Lemma 15.3**

Suppose Theorem 2.1 is valid for all Galois extensions  $K_1/F_1$  with  $F \subseteq F_1 \subseteq K_1 \subseteq K$  and  $[K_1 : F_1] < [K : F]$ . Then

$$\Delta(\chi_{E/F}, \psi_{E/F}) \prod_{\mu \in T} \Delta(\mu', \psi_{F_\mu/F})$$

is equal to

$$\prod_{\mu \in T} \Delta(\mu' \chi_{F_\mu/F}, \psi_{F_\mu/F}).$$

The conclusion of this lemma is the same as that of the previous one. There is however a critical difference in the assumptions.

Let  $F'$  be the fixed field of  $HC$ . If

$$\psi'_{F'} = \psi_{F'/F}$$

then for all separable extensions  $E'$  of  $F'$

$$\psi'_{E'/F'} = \psi_{E'/F}.$$

If  $[K : F'] < [K : F]$  the relation of the lemma is a consequence of the induction assumption and the previous lemma. We thus suppose that  $F = F'$  and  $G = HC$ .

Suppose in addition that there is a subgroup  $C_1$  of  $C$ , which is neither  $C$  nor  $\{1\}$ , whose normalizer contains  $H$ .  $C_1$  is then a normal subgroup of  $G$ . Let  $F_1$  be the fixed field of  $HC_1$  and  $L_1$  the fixed field of  $C_1$ . Lemma 15.1 applies to the extension  $K/F_1$ . Thus there are fields  $A_1, \dots, A_r$  lying between  $F_1$  and  $L_1$  and quasi-characters  $\chi_{A_1}, \dots, \chi_{A_r}$  such that

$$\text{Ind}(W_{K/F_1}, W_{K/E}, \chi_{E/F})$$

is equivalent to

$$\bigoplus_{i=1}^r \text{Ind}(W_{K/F_1}, W_{K/A_i}, \chi_{A_i}).$$

The induction assumption then implies that

$$\Delta(\chi_{E/F}, \psi_{E/F}) \lambda(E/F_1, \psi_{F_1/F}) \tag{15.1}$$

is equal to

$$\prod_{i=1}^r \Delta(\chi_{A_i}, \psi_{A_i/F}) \lambda(A_i/F_1, \psi_{F_1/F}). \quad (15.2)$$

Inducing the first of these two representations from  $W_{K/F_1}$  to  $W_{K/F}$ , we obtain

$$\text{Ind}(W_{K/F}, W_{K/E}, \psi_{E/F}).$$

Thus

$$\oplus_{\mu \in T} \text{Ind}(W_{K/F}, W_{K/F_\mu}, \mu' \chi_{F_\mu/F}) \quad (15.3)$$

is equivalent to

$$\oplus_{i=1}^r \text{Ind}(W_{K/F}, W_{K/A_i}, \chi_{A_i}). \quad (15.4)$$

We recall that there exist surjective homomorphisms

$$\begin{aligned} \tau_{K/F, L_1/F} : W_{K/F} &\longrightarrow W_{L_1/F} \\ \tau_{K/A_i, L_1/A_i} : W_{K/A_i} &\longrightarrow W_{L_1/A_i} \\ \tau_{K/F_\mu, L_1/F_\mu} : W_{K/F_\mu} &\longrightarrow W_{L_1/F_\mu} \end{aligned}$$

whose kernels are all equal to the commutator subgroup  $W_{K/L_1}^c$  of  $W_{K/L_1}$ . Moreover the diagrams

$$\begin{array}{ccc} W_{K/A_i} & \longrightarrow & W_{L_1/A_i} \\ \downarrow & & \downarrow \\ W_{K/F} & \longrightarrow & W_{L_1/F} \end{array}$$

and

$$\begin{array}{ccc} W_{K/F_\mu} & \longrightarrow & W_{L_1/F_\mu} \\ \downarrow & & \downarrow \\ W_{K/F} & \longrightarrow & W_{L_1/F} \end{array}$$

may be supposed commutative. Since  $W_{K/L_1}^c$  lies in the kernel of  $\chi_{A_i}$  and  $\mu' \chi_{F_\mu/F}$  the equivalence of (15.3) and (15.4) amounts to the equivalence of

$$\oplus_{\mu \in T} \text{Ind}(W_{L_1/F}, W_{L_1/F_\mu}, \mu' \chi_{F_\mu/F})$$

and

$$\oplus_{i=1}^r \text{Ind}(W_{L_1/F}, W_{L_1/A_i}, \chi_{A_i}).$$

The induction assumption applied to the extension  $L_1/F$  implies that

$$\prod_{i=1}^r \Delta(\chi_{A_i}, \psi_{A_i/F}) \lambda(A_i/F, \psi_F)$$

is equal to

$$\prod_{\mu \in T} \Delta(\mu' \chi_{F_\mu/F}, \psi_{F_\mu/F}) \lambda(F_\mu/F, \psi_F).$$

It also implies that

$$\lambda(A_i/F, \psi_F) = \lambda(A_i/F_1, \psi_{F_1/F}) \lambda(F_1/F, \psi_F)^{[A_i:F_1]}.$$

Since

$$\sum_i [A_i : F_1] = [E : F_1]$$

we infer from the equality of (15.1) and (15.2) that

$$\Delta(\chi_{E/F}, \psi_{E/F}) \lambda(E/F_1, \psi_{F_1/F}) \lambda(F_1/F, \psi_F)^{[E:F_1]}$$

is equal to

$$\prod_{\mu \in T} \Delta(\mu' \chi_{F_\mu/F}, \psi_{F_\mu/F}) \lambda(F_\mu/F, \psi_F).$$

Taking  $\chi_F = 1$  to find the value of

$$\lambda(E/F_1, \psi_{F_1/F}) \lambda(F_1/F, \psi_F)^{[E:F_1]}$$

and then substituting the result into the equation and cancelling the common factors we obtain the assertion of the lemma.

Now suppose that  $H$  contains a normal subgroup  $H_1 \neq \{1\}$  which lies in the centralizer of  $C$ .  $H_1$  is a normal subgroup of  $G$  if, as we are assuming,  $G = HC$ .  $K_1$ , the fixed field of  $H_1$ , contains  $E$  and all the fields  $F_\mu$ . Lemma 15.1 together with the argument just applied to  $L_1$  shows that

$$\text{Ind}(W_{K_1/F}, W_{K_1/E}, \chi_E)$$

is equivalent to

$$\oplus_{\mu \in T} \text{Ind}(W_{K_1/F}, W_{K_1/F_\mu}, \mu' \chi_{F_\mu/F}).$$

In this case the assertion of the lemma follows from the induction assumption applied to  $K_1/F$ .

We have finally to suppose that  $G = HC$ ,  $C$  contains no proper subgroup invariant under  $H$ , and  $H$  contains no normal subgroup lying in the centralizer of  $C$ . In particular  $H \cap C = \{1\}$ . If  $Z$  is the centralizer of  $C$  then  $Z = (Z \cap H)C$  and  $Z \cap H$  is a normal subgroup of  $H$ . Consequently  $Z = C$ . If  $D$  is a normal subgroup of  $G$  and  $D$  does not contain  $C$  then

$$D \cap C = \{1\}.$$

This implies that  $D$  is contained in  $Z$ . Thus  $D$  is contained in  $C$  and  $D = \{1\}$ . If  $H \neq \{1\}$  the assertion of the lemma is that of the third and fourth main lemmas. If  $H = \{1\}$  then  $G = C$  and  $C$  is cyclic of prime order so that the assertion is that of the first main lemma.

**Chapter Sixteen.****Definition of the  $\lambda$  Functions**

In this and the next three paragraphs, we take a fixed Galois extension  $K/F$ , assume that Theorem 2.1 is valid for all Galois extensions  $K'/F'$  with  $F \subseteq F' \subseteq K' \subseteq K$  and  $[K' : F'] < [K : F]$ , and prove that it is valid for  $K/F$  itself. The first step is to define and establish some simple properties of the function which will serve as the  $\lambda$ -function.

**Lemma 16.1**

*Suppose*

$$E/F' \longrightarrow \lambda(E/F', \psi_{F'})$$

*is a weak  $\lambda$ -function on  $\mathcal{P}_0(K'/F')$ . If  $\sigma \in \mathfrak{G}(K'/F')$  let*

$$E^\sigma = \{\sigma^{-1}(\alpha) \mid \alpha \in E\}.$$

*Then*

$$\lambda(E^\sigma/F', \psi_{F'}) = \lambda(E/F', \psi_{F'}).$$

*If  $\mu$  is a character of  $\mathfrak{G}(K/E)$  let  $\mu^\sigma$  be the character of  $\mathfrak{G}(K/E^\sigma)$  defined by*

$$\mu^\sigma(\rho) = \mu(\sigma\rho\sigma^{-1}).$$

*According to Lemma 13.2*

$$\Delta(\mu^\sigma, \psi_{E^\sigma/F'}) = \Delta(\mu, \psi_{E/F'}).$$

*The representation*

$$\text{Ind}(\mathfrak{G}(K'/F'), \mathfrak{G}(K'/E), \mu)$$

*acts on the space  $U$  of functions  $\varphi$  on  $\mathfrak{G}(K'/F')$  satisfying*

$$\varphi(\rho\tau) = \mu(\rho) \varphi(\tau)$$

*for all  $\tau$  in  $\mathfrak{G}(K'/F')$  and all  $\rho$  in  $\mathfrak{G}(K'/E)$ . The map  $\varphi \longrightarrow \psi$  with*

$$\psi(\tau) = \varphi(\sigma\tau)$$

is a  $\mathfrak{G}(K'/F')$  isomorphism of  $U$  with the space on which

$$\text{Ind}(\mathfrak{G}(K'/F'), \mathfrak{G}(K'/E^\sigma), \mu^\sigma)$$

acts. Thus the two representations are equivalent.

If

$$\oplus_{i=1}^r \text{Ind}(\mathfrak{G}(K'/F'), \mathfrak{G}(K'/E_i), \mu_i)$$

is equivalent to

$$\oplus_{j=1}^s \text{Ind}(\mathfrak{G}(K'/F'), \mathfrak{G}(K'/F_j), \nu_j)$$

then

$$\oplus_{i=1}^r \text{Ind}(\mathfrak{G}(K'/F'), \mathfrak{G}(K'/E_i^\sigma), \mu_i^\sigma)$$

is equivalent to

$$\oplus_{j=1}^s \text{Ind}(\mathfrak{G}(K'/F'), \mathfrak{G}(K'/F_j^\sigma), \nu_j^\sigma)$$

and, with the conventions of the fourth paragraph,

$$\prod_{i=1}^r (\chi_{E_i^\sigma}, \psi_{E_i^\sigma/F'}) \lambda(E_i^\sigma/F', \psi_{F'})$$

is equal to

$$\prod_{j=1}^s \Delta(\chi_{F_j^\sigma}, \psi_{F_j^\sigma/F'}) \lambda(F_j^\sigma/F', \psi_{F'}).$$

Since

$$\Delta(\chi_{F_j^\sigma}, \psi_{F_j^\sigma/F'}) = \Delta(\chi_{F_j}, \psi_{F_j/F'})$$

and

$$\Delta(\chi_{E_i^\sigma}, \psi_{E_i^\sigma/F'}) = \Delta(\chi_{E_i}, \psi_{E_i/F'}).$$

We conclude that

$$\prod_{i=1}^r \Delta(\chi_{E_i}, \psi_{E_i/F'}) \lambda(E_i^\sigma/F', \psi_{F'})$$

is equal to

$$\prod_{j=1}^s \Delta(\chi_{F_j}, \psi_{F_j/F'}) \lambda(F_j^\sigma/F', \psi_{F'}).$$

In other words

$$E/F' \longrightarrow \lambda(E^\sigma/F', \psi_{F'})$$

is a weak  $\lambda$ -function on  $\mathcal{P}_0(K'/F')$ . Lemma 16.1 follows from the uniqueness of such functions.

We return to the problem of defining a  $\lambda$ -function on  $\mathcal{P}_0(K/F)$ . Choose a non-trivial abelian normal subgroup  $C$  of  $G = \mathfrak{G}(K/F)$  and let  $L$  be the fixed field of  $C$ . If  $E$  is any

field lying between  $F$  and  $K$  let  $H$  be the corresponding subgroup of  $G$ . Choose the set  $T$  of characters and the fields  $F_\mu$  as in the previous paragraph. Since  $F_\mu \subseteq L$  the numbers  $\lambda(F_\mu/F, \psi_F)$  are defined.

**Lemma 16.2**

Suppose  $F \subseteq E \subseteq K_1 \subsetneq K$  with  $K_1/F$  normal so that  $\lambda(E/F, \psi_F)$  is defined. Then

$$\lambda(E/F, \psi_F) = \prod_{\mu \in T} \Delta(\mu', \psi_{F_\mu/F}) \lambda(F_\mu/F, \psi_F).$$

Let  $K_1$  be the fixed field of  $H_1$ . If  $H_1 \cap C \neq \{1\}$  we may enlarge  $K_1$  and replace  $H_1$  by  $H_1 \cap C$ . Thus we may suppose that either  $H_1$  is contained in  $C$  or  $H_1 \cap C = \{1\}$ . In either case  $H_1$  is contained in the centralizer of  $C$ . We saw in the previous paragraph that under these circumstance

$$\text{Ind}(W_{K_1/F}, W_{K_1/E}, 1) \simeq \oplus_{\mu \in T} \text{Ind}(W_{K_1/F}, W_{K_1/F_\mu}, \mu').$$

Consequently

$$\lambda(E/F, \psi_F) = \prod_{\mu \in T} \Delta(\mu', \psi_{F_\mu/F}) \lambda(F_\mu/F, \psi_F).$$

In general, we define

$$\lambda(E/F, \psi_F) = \prod_{\mu \in T} \Delta(\mu', \psi_{F_\mu/F}) \lambda(F_\mu/F, \psi_F)$$

if  $E/F$  is in  $\mathcal{P}_0(K/F)$   $T$  is, of course, not always uniquely determined. We may replace any  $\mu$  in  $T$  by  $\mu^\sigma$  with  $\sigma$  in  $H$ . Then  $H_\mu$  and  $G_\mu$  are replaced by  $\sigma^{-1}H_\mu\sigma$  and  $\sigma^{-1}G_\mu\sigma$  while  $F_\mu$  is replaced by  $F_\mu^\sigma$  and  $\mu'$  is replaced by  $(\mu')^\sigma$ . Since

$$\Delta(\mu', \psi_{F_\mu/F}) \lambda(F_\mu/F, \psi_F) = \Delta((\mu')^\sigma, \psi_{F_\mu^\sigma/F}) \lambda(F_\mu^\sigma/F, \psi_F)$$

the number  $\lambda(E/F, \psi_F)$  does not depend on  $T$ . *A priori*, it may depend on  $C$  but that is unimportant since  $C$  is fixed and, the uniqueness having been proved, we are interested only in the existence of a  $\lambda$ -function.

We shall need only one property of the function just defined.

**Lemma 16.3**

If  $F \subseteq E \subseteq E' \subseteq K$  then

$$\lambda(E'/F, \psi_F) = \lambda(E'/E, \psi_{E/F}) \lambda(E/F, \psi_F)^{[E':E]}.$$

If  $E = F$  then

$$\lambda(E'/E, \psi_{E/F}) = \lambda(E'/F, \psi_F)$$

and if  $E \neq F$

$$\lambda(E'/E, \psi_{E/F})$$

is the value of the  $\lambda$ -function of  $\mathcal{P}(K/E)$ , which is defined by assumption, at  $E'/E$ . Since

$$\lambda(F/F, \psi_F) = 1$$

the assertion is clear if  $E = F$ . It is also clear if  $E = E'$ .

Let  $E$  be the fixed field of  $H$  as before and let  $F'$  be the fixed field of  $HC$ . We suppose that  $H \neq G$ . Lemma 4.5 and the induction assumption imply that

$$\lambda(F_\mu/F, \psi_F) = \lambda(F_\mu/F', \psi_{F'/F}) \lambda(F'/F, \psi_F)^{[F_\mu:F']}.$$

The relation

$$[E : F'] = \sum [F_\mu : F']$$

implies that

$$\lambda(E/F, \psi_F) = \lambda(E/F', \psi_{F'/F}) \lambda(F'/F, \psi_F)^{[E:F']}.$$

There is a similar formula for  $\lambda(E'/F, \psi_F)$ . If  $F' \neq F$  the induction assumption implies that

$$\lambda(E'/E, \psi_{E/F}) \lambda(E/F', \psi_{F'/F})^{[E':E]} = \lambda(E'/F', \psi_{F'/F}).$$

Since

$$[E' : F'] = [E' : E] [E : F']$$

the assertion of the lemma is proved simply by multiplying both sides of this equation by

$$\lambda(F'/F, \psi_F)^{[E':F']}.$$

Now suppose that  $G = HC$  and  $H \cap C = \{1\}$ . Let  $E'$  be the fixed field of  $H'$  and let  $F'$  be the fixed field of  $H'C = G'$ . Each character of  $H'$  may be identified with a character of

$C_{E'}/N_{K/E'}C_K$  and each character of  $G'$  may be identified with a character of  $C_{F'}/N_{K/F'}C_K$ . Any character  $\chi_{E'}$  of  $H'$  may be extended to a character  $\chi_{F'}$  of  $G'$  by setting

$$\chi_{F'}(\rho\sigma) = \chi_{E'}(\rho)$$

if  $\rho \in H'$  and  $\sigma \in C$ . Then

$$\chi_{E'} = \chi_{E'/F'}.$$

It follows from Lemma 15.1 that there are fields of  $F_i(E')$ ,  $1 \leq i \leq m(E')$ , lying between  $F'$  and  $L$  and characters  $\mu_{F_i(E')}$  such that

$$\text{Ind}(W_{K/F'}, W_{K/E'}, \chi_{E'})$$

is equivalent to

$$\bigoplus_{i=1}^{m(E')} \text{Ind}(W_{K/F'}, W_{K/F_i(E')}, \mu_{F_i(E')} \chi_{F_i(E')/F'}).$$

If  $E \neq E'$  so that  $F \neq F'$  the induction assumption implies that

$$\Delta(\chi_{E'}, \psi_{E'/F}) \lambda(E'/F', \psi_{F'/F})$$

is equal to

$$\prod_{i=1}^{m(E')} \Delta(\mu_{F_i(E')} \chi_{F_i(E')/F'}, \psi_{F_i(E')/F}) \lambda(F_i(E)/F', \psi_{F'/F}).$$

We have seen that the lemma is valid for any pair  $E', E$  for which  $HC \neq G$ . In particular, it is valid for the pair  $E', F'$  and the pairs  $F_i(E'), F'$ . Multiplying the equality just obtained by

$$\lambda(F'/F, \psi_F)^{[E':F']}$$

we see that

$$\Delta(\chi_{E'}, \psi_{E'/F}) \lambda(E'/F, \psi_F) \tag{16.1}$$

is equal to

$$\prod_{i=1}^{m(E')} \Delta(\mu_{F_i(E')} \chi_{F_i(E')/F'}, \psi_{F_i(E')/F}) \lambda(F_i(E')/F, \psi_F). \tag{16.2}$$

If  $F' = F$  the equality of (16.1) and (16.2), for a suitable choice of the fields  $F_i(E')$ , results from Lemma 15.1, Lemma 15.3, and the definition of

$$\lambda(E'/F, \psi_F).$$

In any case the equality is valid for all fields lying between  $E$  and  $K$ .

Suppose  $E_1, \dots, E_r, E'_1, \dots, E'_s$  are such fields,  $\chi_{E_i}$  is a character of  $C_{E_i}/N_{K/E_i}C_K$ ,  $\chi_{E'_j}$  is a character of  $C_{E'_j}/N_{K/E'_j}C_K$ , and

$$\bigoplus_{i=1}^r \text{Ind}(W_{K/E}, W_{K/E_i}, \chi_{E_i})$$

is equivalent to

$$\bigoplus_{j=1}^s \text{Ind}(W_{K/E}, W_{K/E'_j}, \chi_{E'_j}).$$

Then

$$\sum_{i=1}^r [E_i : E] = \sum_{j=1}^s [E'_j : E] \quad (16.3)$$

and, by the transitivity of the induction process,

$$\bigoplus_{i=1}^r \bigoplus_{k=1}^{m(E_i)} \text{Ind}(W_{K/F}, W_{K/F_k(E_i)}, \mu_{F_k(E_i)} \chi_{F_k(E_i)/F_i})$$

is equivalent to

$$\bigoplus_{j=1}^s \bigoplus_{\ell=1}^{m(E'_j)} \text{Ind}(W_{K/F}, W_{K/F_\ell(E'_j)}, \mu_{F_\ell(E'_j)} \chi_{F_\ell(E'_j)/F'_j}).$$

If  $E_i$  is the fixed field of  $H_i$  and  $E'_j$  the fixed field of  $H'_j$  then  $F_i$  and  $F'_j$  are the fixed fields of  $H_i C$  and  $H'_j C$ . This equivalence and the induction assumption for  $L/F$  imply that

$$\prod_{i=1}^r \prod_{k=1}^{m(E_i)} \Delta(\mu_{F_k(E_i)} \chi_{F_k(E_i)/F_i}, \psi_{F_k(E_i)/F}) \lambda(F_k(E_i)/F, \psi_F)$$

is equal to

$$\prod_{j=1}^s \prod_{\ell=1}^{m(E'_j)} \Delta(\mu_{F_\ell(E'_j)} \chi_{F_\ell(E'_j)/F'_j}, \psi_{F_\ell(E'_j)/F}) \lambda(F_\ell(E'_j)/F, \psi_F).$$

This equality, the equality of (16.1) and (16.2), and the relation (16.3) imply that

$$\prod_{i=1}^r \Delta(\chi_{E_i}, \psi_{E_i/F}) \lambda(E_i/F, \psi_F) \lambda(E/F, \psi_F)^{-[E_i:E]}$$

is equal to

$$\prod_{j=1}^s \Delta(\chi_{E'_j}, \psi_{E'_j/F}) \lambda(E'_j/F, \psi_F) \lambda(E/F, \psi_F)^{-[E'_j:E]}.$$

Consequently

$$E' \longrightarrow \lambda(E'/F, \psi_F) \lambda(E/F, \psi_F)^{-[E':E]}$$

is a weak  $\lambda$ -function on  $\mathcal{P}_0(K/E)$ . The lemma of uniqueness implies that

$$\lambda(E'/F, \psi_F) \lambda(E/F, \psi_F)^{-[E':E]} = \lambda(E'/E, \psi_{E/F}).$$

This is, of course, the assertion of the lemma.

At this point, we have proved the lemma when various supplementary conditions are satisfied. Before proving it, in general, we make an observation. Suppose

$$F \subseteq E \subseteq E' \subseteq E'' \subseteq K$$

and the assertion of the lemma is valid for  $E''/E'$  and  $E'/E$ . Then

$$\lambda(E''/F, \psi_F) = \lambda(E''/E', \psi_{E'/F}) \lambda(E'/F, \psi_F)^{[E'':E']}$$

and

$$\lambda(E'/F, \psi_F) = \lambda(E'/E, \psi_{E/F}) \lambda(E/F, \psi_F)^{[E':E]}.$$

Moreover, by induction,

$$\lambda(E''/E, \psi_{E/F}) = \lambda(E''/E', \psi_{E'/F}) \lambda(E'/E, \psi_{E/F})^{[E'':E']}.$$

The assertion for  $E''/E$  is obtained by substituting the second relation in the first and simplifying according to the third.

If the lemma is false in general, choose amongst all the extensions in  $\mathcal{P}(K/F)$  for which it is false one  $E'/E$  for which  $[E' : E]$  is a minimum. Let  $E$  be the fixed field of  $H$  and  $E'$  that of  $H'$ . According to the previous discussion  $G = HC$ ,  $H \cap C \neq \{1\}$ , and there are no fields lying between  $E$  and  $E'$ . If  $H' \cap C = H \cap C$ , which is a normal subgroup of  $G$ , the fields  $F$ ,  $E$ , and  $E'$  are contained in the fixed field of  $H \cap C$  and the assertion is a consequence of the induction assumption. Thus  $H'$  is a proper subgroup of  $H'(H \cap C)$ . Because there are no intermediate fields  $H = H'(H \cap C)$ .

As we have seen there are fields  $E_1, \dots, E_r$  lying between  $E$  and the fixed field  $K_1$  of  $H \cap C$  and characters  $\mu_{E_1}, \dots, \mu_{E_r}$  such that

$$\text{Ind}(W_{K/E}, W_{K/E'}, 1)$$

is equivalent to

$$\oplus_{i=1}^r \text{Ind}(W_{K/E}, W_{K/E_i}, \mu_{E_i}).$$

Then

$$\lambda(E'/E, \psi_{E/F}) = \prod_{i=1}^r \Delta(\mu_{E_i}, \psi_{E_i/E}) \lambda(E_i/E, \psi_{E/F}).$$

By the induction assumption, applied to  $K_1/F$ ,

$$\lambda(E_i/E, \psi_{E/F}) \lambda(E/F, \psi_F)^{[E_i:E]} = \lambda(E_i/F, \psi_F).$$

Thus

$$\lambda(E'/E, \psi_{E/F}) \lambda(E/F, \psi_F)^{[E':E]}$$

is equal to

$$\prod_{i=1}^r \Delta(\mu_{E_i}, \psi_{E_i/E}) \lambda(E_i/F, \psi_F). \quad (16.4)$$

Moreover, by the transitivity of the induction process,

$$\text{Ind}(W_{K/F}, W_{K/E'}, 1) \quad (16.5)$$

is equivalent to

$$\oplus_{i=1}^r \text{Ind}(W_{K/F}, W_{K/E_i}, \mu_{E_i}). \quad (16.6)$$

On the other hand, there are fields  $F_1, \dots, F_s$  contained in  $L$  and characters  $\nu_{F_1}, \dots, \nu_{F_s}$  such that (16.5) is equivalent to

$$\oplus_{j=1}^s \text{Ind}(W_{K/F}, W_{K/F_j}, \nu_{F_j}) \quad (16.7)$$

and such that, by definition,

$$\lambda(E'/F, \psi_F) = \prod_{j=1}^s \Delta(\nu_{F_j}, \psi_{F_j/F}) \lambda(F_j/F, \psi_F). \quad (16.8)$$

Since the representations (16.6) and (16.7) are equivalent the induction assumption, applied to  $K_1/F$ , shows that (16.4) is equal to the right side of (16.8). This is a contradiction.

## Chapter Seventeen.

### A Simplification.

We shall use the symbol  $\Omega$  to denote an orbit in the set of quasi-characters of  $C_K$  under the action of  $\mathfrak{G}(K/F)$  or, what is the same, under the action of  $W_{K/F}$  on  $C_K$  by means of inner automorphisms. If  $\chi_K$  is a quasi-character of  $C_K$  its orbit will be denoted  $\Omega(\chi_K)$ . If  $\rho$  is a representation of  $W_{K/F}$  the restriction of  $\rho$  to  $C_K$  is the direct sum of one-dimensional representations. Let  $S(\rho)$  be the collection of quasi-characters to which these one-dimensional representations correspond.

Suppose

$$\rho = \text{Ind}(W_{K/F}, W_{K/E}, \chi_E).$$

Let  $W_{K/F}$  be the disjoint union

$$\bigcup_{i=1}^m W_{K/E} w_i.$$

Define the function  $\varphi_i$  by

$$\begin{aligned} \varphi_i(w w_j) &= 0 & w \in W_{K/E}, \quad j \neq i \\ \varphi_i(w w_i) &= \chi_E(\tau_{K/E} w) & w \in W_{K/E}. \end{aligned}$$

$\{\varphi_1, \dots, \varphi_m\}$  is a basis for the space of functions of which  $\rho$  acts. If  $a \in C_K$  then

$$w w_j a = w(w_j a w_j^{-1}) w_j$$

and  $w_j a w_j^{-1}$  belongs to  $C_K$  which, of course, lies in  $W_{K/E}$ . Thus

$$\rho(a) \varphi_i = \chi_E(\tau_{K/E}(w_i a w_i^{-1})) \varphi_i = \chi_{K/E}^{\sigma_i}(a) \varphi_i$$

if  $\sigma_i$  is the image of  $w_i$  in  $\mathfrak{G}(K/F)$ . Thus

$$S(\rho) = \Omega(\chi_{K/E}).$$

Suppose  $E_1, \dots, E_r, E'_1, \dots, E'_s$  lie between  $F$  and  $K$ ,  $\chi_{E_i}$  is a quasi-character of  $E_i$ , and  $\chi_{E'_j}$  is a quasi-character of  $E'_j$ . Let

$$\rho_i = \text{Ind}(W_{K/F}, W_{K/E_i}, \chi_{E_i})$$

and let

$$\rho'_j = \text{Ind}(W_{K/F}, W_{K/E'_j}, \chi_{E'_j}).$$

Suppose  $\rho_i$  acts on  $V_i$  and  $\rho'_j$  acts on  $V'_j$ . The direct sum of the representations  $\rho_i$  acts on

$$V = \bigoplus_{i=1}^r V_i$$

and the direct sum of the representations  $\rho'_j$  acts on

$$V' = \bigoplus_{j=1}^s V'_j.$$

Let

$$\begin{aligned} V_\Omega &= \bigoplus_{\{i \mid \chi_{K/E_i} \in \Omega\}} V_i \\ V'_\Omega &= \bigoplus_{\{i \mid \chi_{K/E'_j} \in \Omega\}} V'_j. \end{aligned}$$

Any isomorphism of  $V$  with  $V'$  which commutes with the action of  $W_{K/F}$  takes  $V_\Omega$  to  $V'_\Omega$ .

If  $\chi_{K/E_i} \in \Omega(\chi_K)$  there is a  $\sigma$  in  $\mathfrak{G}(K/F)$  such that  $\chi_K = \chi_{K/E_i}^\sigma$ . Then

$$\rho_i \simeq \text{Ind}(W_{K/F}, W_{K/E_i}^\sigma, \chi_{E_i}^\sigma)$$

and

$$\Delta(\chi_{E_i}, \psi_{E_i/F}) \lambda(E_i/F, \psi_F) = \Delta(\chi_{E_i}^\sigma, \psi_{E_i^\sigma/F}) \lambda(E_i^\sigma/F, \psi_F).$$

We conclude that Theorem 2.1 is a consequence of the following lemma.

**Lemma 17.1**

Suppose  $\chi_K$  is a quasi-character of  $C_K$ . Suppose  $E_1, \dots, E_r, E'_1, \dots, E'_s$  lie between  $F$  and  $K$ ,  $\chi_{E_i}$  is a quasi-character of  $C_{E_i}$ ,  $\chi_{E'_j}$  is a quasi-character of  $C_{E'_j}$ , and

$$\rho = \bigoplus_{i=1}^r \text{Ind}(W_{K/F}, W_{K/E_i}, \chi_{E_i})$$

is equivalent to

$$\rho' = \bigoplus_{j=1}^s \text{Ind}(W_{K/F}, W_{K/E'_j}, \chi_{E'_j}).$$

If  $\chi_{K/E_i} = \chi_{K/E'_j} = \chi_K$  for all  $i$  and  $j$  then

$$\prod_{i=1}^r \Delta(\chi_{E_i}, \psi_{E_i/F}) \lambda(E_i/F, \psi_F)$$

is equal to

$$\prod_{j=1}^s \Delta(\chi_{E'_j}, \psi_{E'_j/F}, \lambda(E'_j/F, \psi_F)).$$

Let  $F(\chi_K)$  be the fixed field of the isotropy group of  $\chi_K$ . Let  $\rho$  act on  $V$  and let  $\rho'$  act on  $V'$ . Let

$$V(\chi_K) = \{v \in V \mid \rho(a)v = \chi_K(a)v \text{ for all } a \text{ in } C_K\}.$$

Define  $V'(\chi_K)$  in a similar fashion. It is clear that any isomorphism of  $V$  with  $V'$  which commutes with the action of  $W_{K/F}$  takes  $V(\chi_K)$  to  $V'(\chi_K)$ . The group  $W_{K/F(\chi_K)}$  leaves both  $V(\chi_K)$  and  $V'(\chi_K)$  invariant and its representations on these two spaces are equivalent.

Let

$$\text{Ind}(W_{K/F}, W_{K/E_i}, \chi_{E_i})$$

acts on  $V_i$  and define  $V_i(\chi_K)$  in the obvious manner. Then

$$V(\chi_K) = \oplus_{i=1}^r V_i(\chi_K).$$

Defining  $V'_j$  and  $V'_j(\chi_K)$  in a similar manner, we have

$$V'(\chi_K) = \oplus_{j=1}^s V'_j(\chi_K).$$

It is clear that the representation of  $W_{K/F(\chi_K)}$  on  $V_i(\chi_K)$  is equivalent to

$$\text{Ind}(W_{K/F(\chi_K)}, W_{K/E_i}, \chi_{E_i}).$$

Thus

$$\oplus_{i=1}^r \text{Ind}(W_{K/F(\chi_K)}, W_{K/E_i}, \chi_{E_i})$$

is equivalent to

$$\oplus_{j=1}^s \text{Ind}(W_{K/F(\chi_K)}, W_{K/E'_j}, \chi_{E'_j}).$$

If  $F(\chi_K) \neq F$  the assertion of the lemma follows from the induction assumption and Lemma 16.3.

## Chapter Eighteen.

### Nilpotent Groups.

In this paragraph we prove Lemma 17.1 assuming that  $F = F(\chi_K)$  and that  $G = \mathfrak{G}(K/F)$  is nilpotent.

#### Lemma 18.1

Suppose  $D$  is a normal subgroup of  $G$  of prime order  $\ell$  which is contained in the center of  $G$ . Let  $M$  be the fixed field of  $D$ . Suppose  $F \subseteq E \subseteq K$  and  $\chi_E$  is a quasi-character of  $C_E$ . Suppose also that  $F(\chi_{K/E}) = F$ .

- (a) There are fields  $F_1, \dots, F_r$  contained in  $M$  and quasi-characters  $\chi_{F_1}, \dots, \chi_{F_r}$  such that  $\chi_{K/F_i} = \chi_{K/E}$  and such that

$$\text{Ind}(W_{K/F}, W_{K/E}, \chi_E)$$

is equivalent to

$$\bigoplus_{i=1}^r \text{Ind}(W_{K/F}, W_{K/F_i}, \chi_{F_i}).$$

- (b) If Theorem 2.1 is valid for all Galois extensions  $K'/F'$  in  $\mathcal{P}(K/F)$  with  $[K' : F'] < [K : F]$  then

$$\Delta(\chi_E, \psi_{E/F}) \lambda(E/F, \psi_F)$$

is equal to

$$\prod_{i=1}^r \Delta(\chi_{F_i}, \psi_{F_i/F}) \lambda(F_i/F, \psi_F).$$

We prove the lemma by induction on  $[K : F]$ . Let  $H$  be the subgroup of  $G$  corresponding to  $E$ ; let  $G' = HD$  and let  $F'$  be the fixed field of  $G'$ . If  $F' \neq F$  the induction assumption implies that there are fields  $F_1, \dots, F_r$  contained in  $M$  and quasi-characters  $\chi_{F_1}, \dots, \chi_{F_r}$  such that  $\chi_{K/F_i} = \chi_{K/E}$  for each  $i$  and such that

$$\text{Ind}(W_{K/F}, W_{K/E}, \chi_E)$$

is equivalent to

$$\bigoplus_{i=1}^r \text{Ind}(W_{K/F'}, W_{K/F_i}, \chi_{F_i}).$$

The first part of the lemma follows from the transitivity of the induction process. The second part follows from Lemma 16.3 and the assumed validity of Theorem 2.1 for the extension  $K/F'$ .

We suppose now that  $G = HD$ . Suppose that  $H$  contains a normal subgroup  $H_1$  of  $G$  which is different from  $\{1\}$  and suppose that, if  $K_1$  is the fixed field of  $H_1$ ,  $F(\chi_{K_1/E}) = F$ . If  $M_1$  is the fixed field of  $H_1D$  then, according to the induction assumption, there are fields  $F_1, \dots, F_r$  contained in  $M_1$  and quasi-characters  $\chi_{F_1}, \dots, \chi_{F_r}$  such that

$$\chi_{K_1/F_i} = \chi_{K_1/E}$$

and such that

$$\text{Ind}(W_{K_1/F}, W_{K_1/E}, \chi_E)$$

is equivalent to

$$\bigoplus_{i=1}^r \text{Ind}(W_{K_1/F}, W_{K_1/F_i}, \chi_{F_i}).$$

It follows immediately that

$$\chi_{K/F_i} = \chi_{K/E}$$

and that

$$\text{Ind}(W_{K/F}, W_{K/E}, \chi_E)$$

is equivalent to

$$\bigoplus_{i=1}^r \text{Ind}(W_{K/F}, W_{K/F_i}, \chi_{F_i}).$$

The equality of (b) is a consequence of the assumed validity of Theorem 2.1 for  $K_1/F$ .

We assume now that  $G = HD$  and that if  $H_1$  is a normal subgroup of  $H$  different from  $\{1\}$  with fixed field  $K_1$  the field  $F(\chi_{K_1/E})$  is not  $F$ . If  $w_1$  belongs to  $W_{K/E}$  and  $w_2$  belongs to  $W_{K/M}$  then

$$w_1 w_2 w_1^{-1} w_2^{-1} \in C_K.$$

Let  $\chi_K = \chi_{K/E}$ . Since  $F(\chi_K) = F$

$$\chi_K(w_1 w_2 w_1^{-1} w_2^{-1}) = \chi_K(w_2 w_1^{-1} w_2^{-1} w_1) = \chi_K(w_1^{-1} w_2^{-1} w_1 w_2) = \chi_K(w_2^{-1} w_1 w_2 w_1^{-1}).$$

Denote the common value of the expressions by  $\omega(w_1, w_2)$ . Then  $\omega(v_1 w_1, w_2)$  is equal to

$$\chi_K(v_1 w_1 w_2 w_1^{-1} v_1^{-1} w_2^{-1}) = \chi_K(w_2^{-1} w_1 w_2 w_1^{-1} v_1^{-1} w_2^{-1} v_1 w_2).$$

The right side is

$$\omega(v_1, w_2) \omega(w_1, w_2).$$

In the same way  $\omega(w_1, v_2 w_2)$  is

$$\chi_K(w_1 v_2 w_2 w_1^{-1} w_2^{-1} v_2^{-1}) = \chi_K(w_1^{-1} v_2^{-1} w_1 v_2 w_2 w_1^{-1} w_2^{-1} w_1)$$

which equals

$$\omega(w_1, v_2) \omega(w_1, w_2).$$

If either  $w_1$  or  $w_2$  belong to  $C_K$ , we have

$$\omega(w_1, w_2) = 1.$$

Thus, for each  $w_2$ ,

$$w_1 \longrightarrow \omega(w_1, w_2)$$

is a homomorphism of  $H = W_{K/E}/C_K$  into  $\mathbb{C}^*$  and, for each  $w_1$ ,

$$w_2 \longrightarrow \omega(w_1, w_2)$$

is a homomorphism of  $D = W_{K/M}/C_K$  into  $\mathbb{C}^*$ . If  $w$  belongs to  $W_{K/F}$  then

$$\omega(ww_1w^{-1}, ww_2w^{-1}) = \omega(w_1, w_2).$$

Thus there is a normal extension  $K_1$  containing  $E$  such that

$$W_{K/K_1} = \{w_1 \mid \omega(w_1, w_2) = 1 \text{ for all } w_2 \in W_{K/M}\}.$$

But  $F(\chi_{K_1/E})$  will be  $F$  so that  $K_1$  must be  $K$ .

It follows immediately that  $H$  is isomorphic to a subgroup of the dual group of  $D$ . Thus  $H = \{1\}$  or  $H$  is cyclic of order  $\ell$ . In either case  $H$  must lie in the centralizer of  $D$  so that  $E/F$  is normal and  $\mathfrak{G}(E/F)$  is isomorphic to  $D$ . If  $H = \{1\}$  then  $\chi_E$  may be extended from  $C_E = C_K$  to a quasi-character of  $W_{E/F}$ . In other words, there is a quasi-character  $\chi_F$  of  $C_F$  such that  $\chi_E = \chi_{E/F}$ . Then

$$\text{Ind}(W_{K/F}, W_{K/E}, \chi_E)$$

is equivalent to

$$\oplus_{\mu_F \in S(E/F)} \text{Ind}(W_{K/F}, W_{K/F}, \mu_F \chi_F).$$

Suppose  $H \neq \{1\}$ . Since  $W_{K/M}/C_K$  is cyclic there is a quasi-character  $\chi_M$  of  $C_M$  such that  $\chi_K = \chi_{K/M}$ . If  $w_1$  belongs to  $W_{K/E}$  let  $\chi_{w_1}$  be the character of  $W_{K/M}$  or, what is the same, of  $C_M$  defined by

$$\chi_{w_1}(w_2) = \omega(w_1, w_2)$$

and if  $w_2$  belongs to  $W_{K/M}$  let

$$\chi_{w_2}(w_1) = \omega(w_1, w_2).$$

Clearly

$$\{\chi_{w_1} \mid w_1 \in W_{K/E}\} = S(K/M)$$

and

$$\{\chi_{w_2} \mid w_2 \in W_{K/M}\} = S(K/E).$$

If  $\sigma_1$  is the image of  $w_1$  in  $H$  and  $\sigma_2$  the image of  $w_2$  in  $D$  then

$$\chi_E^{\sigma_2}(w_1) = \chi_E(w_2 w_1 w_2^{-1} w_1^{-1} w_1) = \chi_{w_2}^{-1}(w_1) \chi_E(w_1)$$

and

$$\chi_M^{\sigma_1}(w_2) = \chi_M(w_1 w_2 w_1^{-1} w_2^{-1} w_2) = \chi_{w_1}(w_2) \chi_M(w_2).$$

Let  $W_{K/F}$  be the disjoint union

$$\bigcup_{i=1}^{\ell} W_{K/E} v_i$$

with  $v_i$  in  $W_{K/M}$ . Define the function  $\varphi_i$  on  $W_{K/F}$  by

$$\varphi_i(w v_j) = 0$$

if  $w \in W_{K/E}$  and  $j \neq i$  and by

$$\varphi_i(w v_i) = \chi_E(w)$$

if  $w \in W_{K/E}$ . Then

$$\{\varphi_i \mid 1 \leq i \leq \ell\}$$

is a basis for the space  $U$  on which

$$\text{Ind}(W_{K/F}, W_{K/E}, \chi_E)$$

acts. Let  $\psi_i$ ,  $1 \leq i \leq \ell$  be the function  $W_{K/F}$  defined by

$$\psi_i(w_2 w_1) = \chi_M(w_2) \chi_E^{\sigma(v_i)}(w_1)$$

if  $w_1$  belongs to  $W_{K/E}$  and  $w_2$  belongs to  $W_{K/M}$ . Here  $\sigma(v_i)$  is the image of  $v_i$  in  $\mathfrak{G}(K/F)$ . It is necessary, but easy, to verify that  $\psi_i$  is well-defined. The collection

$$\{\psi_i \mid 1 \leq i \leq \ell\}$$

is a basis for the space  $V$  on which

$$\text{Ind}(W_{K/F}, W_{K/M}, \chi_M)$$

acts. It is easily verified that the isomorphism of  $U$  with  $V$  which sends  $\chi_M(v_i)\varphi_i$  to  $\psi_i$  is an isomorphism. Thus

$$\text{Ind}(W_{K/F}, W_{K/E}, \chi_E) \simeq \text{Ind}(W_{K/F}, W_{K/M}, \chi_M).$$

This takes care of the first part of the lemma.

Whether  $H = \{1\}$  or not,

$$\text{Ind}(W_{K/F}, W_{K/E}, 1)$$

is equivalent to

$$\bigoplus_{\mu_F \in S(E/F)} \text{Ind}(W_{K/F}, W_{K/F}, \mu_F).$$

If  $H \neq 1$  we may apply Theorem 2.1 to  $E/F$  to see that

$$\lambda(E/F, \psi_F) = \prod_{\mu_F \in S(E/F)} \Delta(\mu_F, \psi_F).$$

If  $H = \{1\}$  this equality is just the definition of the left side. In this case the second part of the lemma asserts that

$$\Delta(\chi_E, \psi_{E/F}) \prod_{\mu_F \in S(E/F)} \Delta(\mu_F, \psi_F) \tag{18.1}$$

is equal to

$$\prod_{\mu_F \in S(E/F)} \Delta(\mu_F \chi_F, \psi_F)$$

where  $\chi_E = \chi_{E/F}$ . This is a consequence of the first main lemma. If  $H \neq \{1\}$ , Theorem 2.1 applied to  $M/F$ , shows that

$$\lambda(M/F, \psi_F) = \prod_{\mu_F \in S(M/F)} \Delta(\mu_F, \psi_F)$$

and the second part of the lemma asserts that (18.1) is equal to

$$\Delta(\chi_M, \psi_{M/F}) \prod_{\mu_F \in S(M/F)} \Delta(\mu_F, \psi_F).$$

This is a consequence of the second main lemma.

A non-trivial nilpotent group always contains a subgroup  $D$  satisfying the conditions of the previous lemma. Lemma 17.1 is clear if  $K = F$ . If  $K \neq F$  and  $\mathfrak{G}(K/F)$  is nilpotent it is a consequence of the following lemma.

**Lemma 18.2**

Suppose  $K/F$  is normal and Theorem 2.1 is valid for all normal extensions  $K'/F'$  in  $\mathcal{P}(K/F)$  with  $[K' : F'] < [K : F]$ . Suppose  $F \subseteq M \subsetneq K$  and  $M/F$  is normal. Suppose  $E_1, \dots, E_r, E'_1, \dots, E'_s$  lie between  $F$  and  $M$ ,  $\chi_{E_i}$  is a quasi-character of  $C_{E_i}$ ,  $\chi_{E'_j}$  is a quasi-character of  $C_{E'_j}$ , and

$$\oplus_{i=1}^r \text{Ind}(W_{K/F}, W_{K/E_i}, \chi_{E_i})$$

is equivalent to

$$\oplus_{j=1}^s \text{Ind}(W_{K/F}, W_{K/E'_j}, \chi_{E'_j}).$$

Then

$$\prod_{i=1}^r \Delta(\chi_{E_i}, \psi_{E_i/F}) \lambda(E_i/F, \psi_F)$$

is equal to

$$\prod_{j=1}^s \Delta(\chi_{E'_j}, \psi_{E'_j/F}) \lambda(E'_j/F, \psi_F).$$

The representation

$$\text{Ind}(W_{K/F}, W_{K/E_i}, \chi_{E_i})$$

can be obtained by inflating the representation

$$\text{Ind}(W_{M/F}, W_{M/E_i}, \chi_{E_i})$$

from  $W_{M/F}$  to  $W_{K/F}$ . A similar remark applies to the representations induced from the  $\chi_{E'_j}$ . Thus

$$\oplus_{i=1}^r \text{Ind}(W_{M/F}, W_{M/E_i}, \chi_{E_i})$$

is equivalent to

$$\oplus_{j=1}^s \text{Ind}(W_{M/F}, W_{M/E'_j}, \chi_{E'_j}).$$

Applying Theorem 2.1 to the extension  $M/F$  we obtain the lemma.

## Chapter Nineteen.

### Proof of the Main Theorem.

We shall first prove Lemma 17.1 when there is a quasi-character  $\chi_F$  of  $C_F$  such that  $\chi_K = \chi_{K/F}$ . Implicit in the statement of the following lemma as in that of Lemma 17.1, is the assumption that Theorem 2.1 is valid for all pairs  $K'/F'$  in  $\mathcal{P}(K/F)$  for which  $[K' : F'] < [K : F]$ . Recall that we have fixed a non-trivial abelian normal subgroup  $C$  of  $G = \mathfrak{G}(K/F)$  and that  $L$  is its fixed field.

#### Lemma 19.1

*Suppose  $F \subseteq E \subseteq K$ ,  $\chi_F$  is a quasi-character of  $C_F$ ,  $\chi_E$  is a quasi-character of  $C_E$ , and  $\chi_{K/E} = \chi_{K/F}$ . There are fields  $F_1, \dots, F_r$  contained in  $L$  and quasi-characters  $\chi_{F_i}$ ,  $1 \leq i \leq r$ , such that  $\chi_{K/F_i} = \chi_{K/F}$ ,*

$$\text{Ind}(W_{K/F}, W_{K/E}, \chi_E)$$

*is equivalent to*

$$\bigoplus_{i=1}^r \text{Ind}(W_{K/F}, W_{K/F_i}, \chi_{F_i})$$

*and*

$$\Delta(\chi_E, \psi_{E/F}) \lambda(E/F, \psi_F)$$

*is equal to*

$$\prod_{i=1}^r \Delta(\chi_{F_i}, \psi_{F_i/F}) \lambda(F_i/F, \psi_F).$$

We prove the lemma by induction on  $[K : F]$ . Let  $E$  be the fixed field of  $H$  and let  $F'$  be the fixed field of  $HC$ . If  $F' \neq F$  then, by induction, there are fields  $F_1, \dots, F_r$  lying between  $F'$  and  $L$  and quasi-characters  $\chi_{F_1}, \dots, \chi_{F_r}$  such that  $\chi_{K/F_i} = \chi_{K/F}$  and

$$\text{Ind}(W_{K/F'}, W_{K/E}, \chi_E)$$

*is equivalent to*

$$\bigoplus_{i=1}^r \text{Ind}(W_{K/F'}, W_{K/F_i}, \chi_{F_i}).$$

In this case the lemma follows from the transitivity of the induction process, the assumed validity of Theorem 2.1 for  $K/F'$  and Lemma 16.3.

We suppose henceforth that  $G = HC$ . There is a character  $\theta_E$  in  $S(K/E)$  such that  $\chi_E = \theta_E \chi_{E/F}$ .  $\theta_E$  may be regarded as a character of  $H$ . If  $H \cap C = \{1\}$  we may define a character  $\theta_F$  of  $G$  by setting

$$\theta_F(hc) = \theta_E(h)$$

if  $h$  is in  $H$  and  $c$  is in  $C$ .  $\theta_F$  may be regarded as a character of  $C_F$  and  $\theta_E = \theta_{E/F}$ . Replacing  $\chi_F$  by  $\theta_F \chi_F$  we suppose that  $\chi_E = \chi_{E/F}$ . Then in the notation of Lemma 15.1, we may take

$$\{F_1, \dots, F_r\} = \{F_\mu \mid \mu \in T\}$$

and if  $F_i = F_\mu$ ,

$$\chi_{F_i} = \mu' \chi_{F_\mu/F}.$$

The assertions of the lemma are consequences of Lemmas 15.1 and 15.3.

We suppose now not only that  $G = HC$  but also that  $H \cap C \neq \{1\}$ . Let  $S$  be the set of characters in  $S(K/L)$  whose restriction to  $H \cap C$  agrees with the restriction of  $\theta_E$ .  $S$  is invariant under the action of  $H$  on  $S(K/L)$ . If  $\nu$  belongs to  $S$  let  $\varphi_\nu$  be the function on  $W_{K/F}$  defined by

$$\varphi_\nu(wv) = \chi_E(w) \chi_{L/F}(v) \nu(v)$$

if  $w$  is in  $W_{K/E}$  and  $v$  is in  $W_{K/L}$ .  $\nu$  is a character of  $C$  and may therefore be regarded as a character of  $W_{K/L}$  or of  $C_L$ . It is easy to verify that  $\varphi_\nu$  is well-defined. If

$$\rho = \text{Ind}(W_{K/F}, W_{K/E}, \chi_E)$$

then

$$\{\varphi_\nu \mid \nu \in S\}$$

is a basis for the space of functions on which  $\rho$  acts. If  $w$  belongs to  $W_{K/E}$

$$\rho(w)\varphi_\nu = \chi_E(w)\varphi_{\nu'}$$

with  $\nu' = \nu^{\sigma^{-1}}$  is  $\sigma$  is the image of  $w$  in  $\mathfrak{G}(K/F)$ . If  $v$  belongs to  $W_{K/L}$

$$\rho(v)\varphi_\nu = \chi_{L/F}(v) \nu(v)\varphi_\nu.$$

Thus if  $R$  is an orbit in  $S$  under the action of  $H$ , the space

$$V_R = \sum_{\nu \in R} \mathbb{C}_{\varphi_\nu}$$

is invariant under  $W_{K/F}$  and  $\rho$  is the direct sum of its restrictions to the spaces  $V_R$ .

If  $\mu$  belongs to  $R$  let  $H_\mu$  be the isotropy group of  $\mu$ , let  $G_\mu = H_\mu C$ , and let  $F_\mu$  be the fixed field of  $G_\mu$ . Extend  $\mu$  to a character  $\mu'$  of  $G_\mu$  by setting

$$\mu'(hc) = \theta_E(h) \mu(c)$$

if  $h$  is in  $H_\mu$  and  $c$  is in  $C$ .  $\mu'$ , which is easily seen to be well-defined, may be regarded as a character of  $W_{K/F_\mu}$  of  $C_{F_\mu}$ . Let  $W_{K/F}$  be the disjoint union

$$\bigcup_{i=1}^s W_{K/F_\mu} w_i$$

with  $w_i$  in  $W_{K/E}$  and let  $\sigma_i$  be the image of  $w_i$  in  $\mathfrak{G}(K/F)$ . Let  $\varphi_i$  be the function of  $W_{K/F}$  defined by

$$\begin{aligned} \varphi_i(w w_j) &= 0 & w \in W_{K/F_\mu}, \quad j \neq i \\ \varphi_i(w w_i) &= \mu'(w) \chi_{F_\mu/F}(w) & w \in W_{K/F_\mu}. \end{aligned}$$

The collection

$$\{\varphi_i \mid 1 \leq i \leq s\}$$

is a basis for the space  $V_\mu$  on which the representation

$$\sigma_\mu = \text{Ind}(W_{K/F}, W_{K/F_\mu}, \mu' \chi_{F_\mu/F})$$

acts. Let

$$\psi_i = \chi_E(w_i) \varphi_i.$$

If  $w$  belongs to  $W_{K/L}$

$$\sigma_\mu(w) \psi_i = \mu^{\sigma_i}(w) \chi_{L/F}(w) \psi_i.$$

If  $w$  belongs to  $W_{K/E}$  and  $w_j w = v w_i$  with  $v$  in  $W_{K/F_\mu}$  then

$$\sigma_\mu(w) \psi_i = \chi_E(w) \psi_j.$$

Thus the isomorphism of  $V_\mu$  with  $V_R$  which takes  $\psi_i$  to  $\varphi_{\mu^{\sigma_i}}$  commutes with the action of  $W_{K/F}$ . If  $T$  is a set of representatives for the orbits in  $S$

$$\rho \simeq \bigoplus_{\mu \in T} \sigma_\mu.$$

If  $K_1$  is the fixed field of  $H \cap C$  then  $K_1/F$  is normal and  $\rho$  is the inflation to  $W_{K/F}$  of

$$\text{Ind}(W_{K_1/F}, W_{K_1/E}, \chi_E) \tag{19.1}$$

and  $\sigma_\mu$  is the inflation of

$$\text{Ind}(W_{K_1/F}, W_{K_1/F_\mu}, \mu' \chi_{F_\mu/F}).$$

Thus the representation (19.1) is equivalent to

$$\bigoplus_{\mu \in T} \text{Ind}(W_{K_1/F}, W_{K_1/F_\mu}, \mu' \chi_{F_\mu/F}).$$

Applying Theorem 2.1 to  $K_1/F$  we see that

$$\Delta(\chi_E, \psi_{E/F}) \lambda(E/F, \psi_F)$$

is equal to

$$\prod_{\mu \in T} (\mu' \chi_{F_\mu/F}, \psi_{F_\mu/F}) \lambda(F_\mu/F, \psi_F).$$

If there is a quasi-character  $\chi_F$  such that  $\chi_K = \chi_{K/F}$ , Lemma 17.1 follows from Lemma 18.2 and the lemma just proved. To complete the proof of Theorem 2.1 we have to prove Lemma 17.1 when  $F = F(\chi_K)$ ,  $G$  is not nilpotent, and there is no quasi-character  $\chi_F$  of  $C_F$  such that  $\chi_K = \chi_{K/F}$ . In this case none of the fields  $E_1, \dots, E_r, E'_1, \dots, E'_s$  is equal to  $F$  and Theorem 2.1 may be applied to  $K/E_i$  and  $K/E'_j$ .

### Lemma 19.2

*Suppose  $A$  and  $B$  lie between  $F$  and  $K$ . Suppose  $\chi_A$  and  $\chi_B$  are quasi-characters of  $C_A$  and  $C_B$  respectively. There are fields  $A_1, \dots, A_m$  lying between  $A$  and  $K$ , fields  $B_1, \dots, B_m$  lying between  $B$  and  $K$ , elements  $\sigma_1, \dots, \sigma_m$  in  $G$ , and quasi-characters  $\chi_{A_1}, \dots, \chi_{A_m}, \chi_{B_1}, \dots, \chi_{B_m}$  such that  $B_i = A_i^{\sigma_i}$ ,  $\chi_{B_i} = \chi_{A_i}^{\sigma_i}$ , and such that the tensor product*

$$\text{Ind}(W_{K/F}, W_{K/A}, \chi_A) \otimes \text{Ind}(W_{K/F}, W_{K/B}, \chi_B)$$

*is equivalent to*

$$\bigoplus_{i=1}^m \text{Ind}(W_{K/F}, W_{K/A_i}, \chi_{A_i})$$

*and to*

$$\bigoplus_{i=1}^m \text{Ind}(W_{K/F}, W_{K/B_i}, \chi_{B_i}).$$

Let

$$\begin{aligned} \rho &= \text{Ind}(W_{K/F}, W_{K/A}, \chi_A) \\ \sigma &= \text{Ind}(W_{K/F}, W_{K/B}, \chi_B). \end{aligned}$$

Let  $\alpha$  be the restriction of  $\sigma$  to  $W_{K/A}$  and  $\beta$  the restriction of  $\rho$  to  $W_{K/B}$ . By Lemma 2.3

$$\rho \otimes \sigma \simeq \text{Ind}(W_{K/F}, W_{K/A}, \chi_A \otimes \alpha)$$

and

$$\rho \otimes \sigma \simeq \text{Ind}(W_{K/F}, W_{K/B}, \chi_B \otimes \beta).$$

Let  $W_{K/F}$  be the disjoint union

$$\bigcup_{i=1}^m W_{K/A} w_i W_{K/B}.$$

If  $U_i$  is the space of functions in  $U$ , the space on which  $\rho$  acts, which are zero outside of the double coset  $W_{K/A} w_i W_{K/B}$  then  $U_i$  is invariant under  $\beta$ . Define the field  $B_i$  by demanding that

$$W_{K/B_i} = W_{K/B} \cap w_i^{-1} W_{K/A} w_i.$$

If  $\sigma_i$  is the image of  $w_i$  in  $\mathfrak{G}(K/F)$  let  $\chi'_{B_i}$  be the restriction of  $\chi_A^{\sigma_i}$  to  $W_{K/B_i}$ . If  $U'_i$  is the space of functions on which

$$\text{Ind}(W_{K/B}, W_{K/B_i}, \chi'_{B_i})$$

acts, the map of  $U_i$  to  $U'_i$  which sends  $\varphi$  to the function  $\varphi'$  defined by

$$\varphi'(w) = \varphi(w_i w)$$

if  $w$  is in  $W_{K/B}$  is an isomorphism which commutes with the action of  $W_{K/B}$ . Thus

$$\beta \simeq \oplus_{i=1}^m \text{Ind}(W_{K/B}, W_{K/B_i}, \chi'_{B_i})$$

and, if  $\chi_{B_i} = \chi_{B_i/B} \chi'_{B_i}$ ,

$$\chi_B \otimes \beta \simeq \oplus_{i=1}^m \text{Ind}(W_{K/B}, W_{K/B_i}, \chi_{B_i}).$$

Similar considerations apply if the roles of  $A$  and  $B$  are interchanged. The double coset decomposition becomes

$$\bigcup_{i=1}^m W_{K/B} w_i^{-1} W_{K/A}$$

and

$$W_{K/A_i} = W_{K/A} \cap w_i W_{K/B} w_i^{-1} = w_i W_{K/B_i} w_i^{-1}.$$

Thus  $B_i = A_i^{\sigma_i}$ . It is also clear that  $\chi_{B_i} = \chi_{A_i}^{\sigma_i}$ .

To complete the proof of Lemma 17.1 we use Brauer's theorem in the following form. There are fields  $F_1, \dots, F_n$  lying between  $F$  and  $K$  such that  $\mathfrak{G}(K/F_k)$  is nilpotent for each  $k$ , characters  $\chi_{F_k}$  of  $C_{F_k}/N_{K/F_k}C_K$ , and integers  $m_1, \dots, m_n$  such that

$$1 \simeq \bigoplus_{k=1}^n m_k \operatorname{Ind}(W_{K/F}, W_{K/F_k}, \chi_{F_k}).$$

Since we are assuming that  $G$  is not nilpotent none of the  $F_k$  are equal to  $F$  and we may apply Theorem 2.1 to each of the extensions  $K/F_k$ .

We shall apply the previous lemma with  $A = E_i$ ,  $B = F_k$  and with  $A = E'_j$ ,  $B = F_k$ .  $m$  will be denoted by  $m(ik)$  or  $m'(j\ell)$ .  $A_\ell$  will be denoted by  $E_{ik\ell}$  or  $E'_{jk\ell}$  and  $B_\ell$  will be denoted by  $F_{ik\ell}$  or  $F'_{jk\ell}$ . Observe that

$$\Delta(\chi_{E_{ik\ell}}, \psi_{E_{ik\ell}/F}) \lambda(E_{ik\ell}/F, \psi_F) \quad (19.2)$$

is equal to

$$\Delta(\chi_{F_{ik\ell}}, \psi_{F_{ik\ell}/F}) \lambda(F_{ik\ell}/F, \psi_F) \quad (19.3)$$

and that

$$\Delta(\chi_{E'_{jk\ell}}, \psi_{E'_{jk\ell}/F}) \lambda(E'_{jk\ell}/F, \psi_F) \quad (19.4)$$

is equal to

$$\Delta(\chi_{F'_{jk\ell}}, \psi_{F'_{jk\ell}/F}) \lambda(F'_{jk\ell}/F, \psi_F). \quad (19.5)$$

$\chi_{E_i}$  may be regarded as a one-dimensional representation of  $W_{K/E_i}$  and as such is equivalent to

$$\bigoplus_{k=1}^n \bigoplus_{\ell=1}^{m(ik)} m_k \operatorname{Ind}(W_{K/E_i}, W_{K/E_{ik\ell}}, \chi_{E_{ik\ell}}).$$

Therefore

$$1 = \sum_{k=1}^n \sum_{\ell=1}^{m(ik)} m_k [E_{ik\ell} : E_i]$$

and

$$\Delta(\chi_{E_i}, \psi_{E_i/F})$$

is equal to

$$\prod_{k=1}^n \prod_{\ell=1}^{m(ik)} \{\Delta(\chi_{E_{ik\ell}}, \psi_{E_{ik\ell}/F}) \lambda(E_{ik\ell}/E_i, \psi_{E_i/F})\}^{m_k}.$$

Multiplying both of these expressions by  $\lambda(E_i/F, \psi_F)$ , we see that

$$\Delta(\chi_{E_i}, \psi_{E_i/F}) \lambda(E_i/F, \psi_F) \quad (19.6)$$

is equal to

$$\prod_{k=1}^n \prod_{\ell=1}^{m(ik)} \{ \Delta(\chi_{E_{ik\ell}}, \psi_{E_{ik\ell}/F}) \lambda(E_{ik\ell}/F, \psi_F) \}^{m_k}. \quad (19.7)$$

The same argument establishes that

$$\Delta(\chi_{E'_j}, \psi_{E'_j/F}) \lambda(E'_j/F, \psi_F) \quad (19.8)$$

is equal to

$$\prod_{k=1}^n \prod_{\ell=1}^{m'(jk)} \{ \Delta(\chi_{E'_{jk\ell}}, \psi_{E'_{jk\ell}/F}) \lambda(E'_{jk\ell}/F, \psi_F) \}^{m_k}. \quad (19.9)$$

We are trying to show that the product over  $i$  of the expressions (19.6) is equal to the product over  $j$  of the expressions (19.8). It will be enough to show that the product of the expressions (19.7) is equal to the product of the expressions (19.9).

The representations

$$\bigoplus_{i=1}^r \bigoplus_{\ell=1}^{m(ik)} \text{Ind}(W_{K/F_k}, W_{K/F_{ik\ell}}, \chi_{F_{ik\ell}})$$

and

$$\bigoplus_{j=1}^s \bigoplus_{\ell=1}^{m'(jk)} \text{Ind}(W_{K/F_k}, W_{K/F'_{jk\ell}}, \chi_{F'_{jk\ell}})$$

are equivalent. Therefore

$$\sum_{i=1}^r \sum_{\ell=1}^{m(ik)} [F_{ik\ell} : F_k] = \sum_{j=1}^s \sum_{\ell=1}^{m'(jk)} [F'_{jk\ell} : F_k].$$

Denote the common value of these expressions by  $N(k)$ . Moreover

$$\prod_{i=1}^r \prod_{\ell=1}^{m(ik)} \Delta(\chi_{F_{ik\ell}}, \psi_{F_{ik\ell}/F}) \lambda(F_{ik\ell}/F, \psi_{F_k/F})$$

is equal to

$$\prod_{j=1}^s \prod_{\ell=1}^{m'(jk)} \Delta(\chi_{F'_{jk\ell}}, \psi_{F'_{jk\ell}/F}) \lambda(F'_{jk\ell}/F, \psi_{F_k/F}).$$

Multiplying both of these expressions by

$$\lambda(F_k/F, \psi_F)^{N(k)}$$

we see that

$$\prod_{i=1}^r \prod_{\ell=1}^{m(ik)} \Delta(\chi_{F_{ik\ell}}, \psi_{F_{ik\ell}/F}) \lambda(F_{ik\ell}/F, \psi_F) \quad (19.10)$$

is equal to

$$\prod_{j=1}^s \prod_{\ell=1}^{m'(jk)} \Delta(\chi_{F'_{jk\ell}}, \psi_{F'_{jk\ell}/F}) \lambda(F'_{jk\ell}/F, \psi_F). \quad (19.11)$$

Because of the equality of (19.2) and (19.3) the product over  $i$  of the expressions (19.7) is equal to the product over  $k$  of the  $m_k$ th powers of the expressions (19.10). The product over  $j$  of the expressions (19.9) is equal to the product over  $k$  of the  $m_k$ th powers of the expressions (19.11). Lemma 17.1, and with it Theorem 2.1, is now completely proved.

## Chapter Twenty.

### Artin L-functions.

Suppose  $\omega$  is an equivalence class of representations of the Weil group of the non-archimedean local field  $F$ . Let  $K$  be a Galois extension of  $F$  and let  $\sigma$  be a representation of  $W_{K/F}$  in the class  $\omega$ . Suppose  $\sigma$  acts on  $V$ . Let  $V^0$  be the subspace of  $V$  fixed by every element of  $W_{K/F}^0$ . Since  $W_{K/F}^0$  is a normal subgroup of  $W_{K/F}$  the space  $V^0$  is invariant under  $W_{K/F}$  and on  $V^0$  we get a representation  $\sigma^0$ . Since  $W_{K/F}^0 = \tau_{K/F}^{-1}(u_F^0)$  the class of  $\sigma^0$  depends only on  $w$ .  $\sigma^0$  breaks up into the direct sum of 1-dimensional representations corresponding to unramified generalized characters  $\mu_1, \dots, \mu_r$  of  $C_F$ . We set

$$L(s, w) = \prod_{i=1}^r \frac{1}{1 - \mu_i(\pi_F) |\pi_F|^s}.$$

This we take as the local function. It is clear that when  $w$  is one-dimensional the present definition agrees with that of the introduction and that of  $\omega = \omega_1 \oplus \omega_2$ . Then

$$L(s, \omega) = L(s, \omega_1) \oplus L(s, \omega_2).$$

Suppose  $F \subseteq E \subseteq K$ ,  $\rho$  is a representation of  $W_{K/E}$ , and

$$\sigma = \text{Ind}(W_{K/F}, W_{K/E}, \rho).$$

We have to show that if  $\theta$  is the class of  $\rho$  then

$$L(s, \omega) = L(s, \theta).$$

Let  $\rho$  act on  $W$ . Then  $V$  is the space of functions  $f$  on  $W_{K/F}$  with values in  $W$  which satisfy

$$f(uv) = \rho(u)f(v)$$

for  $u$  in  $W_{K/E}$  and  $v$  in  $W_{K/F}$ . If  $f$  lies in  $V_0$  and  $u$  lies in  $W_{K/E}^0$  then

$$\rho(u)f(v) = f(uv) = f(vv^{-1}uv) = f(v)$$

because  $v^{-1}$  lies in  $W_{K/F}^0$ . Thus  $f$  takes values in  $W^0$ . In other words, we may as well assume that  $W = W^0$ . Indeed we may as well go further and assume that  $W = W^0$  has dimension one.

Let  $N_{E/F} \pi_E = \varepsilon \pi_F^f$  where  $\varepsilon$  is a unit and choose  $w_0$  in  $W_{K/F}$  so that  $\tau_{K/F} w_0 = \pi_F$ . Then  $w^f = u_0 v_0$  with  $u_0$  in  $W_{K/F}^0$  and  $v_0$  in  $W_{K/E}$  such that  $\tau_{K/E} v_0 = \pi_E$ . Clearly,  $V^0$  consists of the functions  $f$  with values in  $W$  which satisfy  $f(uw) = f(w)$  for  $u$  in  $W_{K/F}^0$  and  $f(uw) = \mu(\tau_{K/E} u) f(w)$  if  $\rho$  is associated to the generalized character  $\mu$  of  $C_E$ . Take as basis of  $V^0$  the functions  $\varphi_0, \dots, \varphi_{f-1}$  defined by

$$\varphi_i(uvw_0^j) = \mu(\tau_{K/E} v) \delta_i^j x$$

where  $x$  is a non-zero vector in  $W$ ,  $u$  belongs to  $W_{K/F}^0$ ,  $v$  belongs to  $W_{K/E}$ ,  $0 \leq j < f$ , and  $\delta_i^j$  is Kronecker's delta. The matrix of  $\sigma(w_0)$  with respect to this basis is

$$A = \begin{pmatrix} 0 & \cdot & \cdot & \cdot & \mu(\tau_{K/E} v_0) \\ 1 & 0 & & & \cdot \\ & 1 & \ddots & & \cdot \\ & & \ddots & \ddots & \cdot \\ 0 & & & 1 & 0 \end{pmatrix}$$

and

$$L(s, \omega) = \frac{1}{\det(I - A |\pi_F|^s)} = \frac{1}{1 - \mu(\pi_E) |\pi_F|^{fs}} = L(s, \theta)$$

since  $|\pi_F|^f = |\pi_E|$ .

For archimedean fields we proceed in a different manner. If we write  $\omega$ , as we may, as a sum of irreducible representations the components are unique up to order. If  $\omega = \sum_{i=1}^r \oplus \omega_i$ , we will have to have

$$L(s, \omega) = \prod_{i=1}^r L(s, \omega_i).$$

Thus it is a matter of defining  $L(s, \omega)$  for irreducible  $\omega$ . If  $\omega$  is one-dimensional this was done in the introduction. If  $\omega$  is not one-dimensional then  $F$  must be  $\mathbb{R}$ . Let  $\sigma$  be a representation of  $W_{\mathbb{C}/\mathbb{R}}$  in the class  $\omega$ .  $W_{\mathbb{C}/\mathbb{R}}$  is an extension of the group of order 2 by  $\mathbb{C}^*$ . Let  $W_{\mathbb{C}/\mathbb{R}} = \mathbb{C}^\times \cup w_0 \mathbb{C}^\times$ . If  $\sigma$  acts on  $V$  there is a non-zero vector  $x$  in  $V$  and a generalized character  $\mu$  of  $\mathbb{C}^\times$  such that  $\sigma(a)x = \mu(a)x$  for all  $a$  in  $\mathbb{C}^\times$ . Then the space spanned by  $\{x, \sigma(w_0)x\}$  is invariant and therefore all of  $V$ . Since  $V$  is not one-dimensional  $\sigma(w_0)x$  is not a multiple of  $x$ . Notice that  $\sigma(a)\sigma(w_0)x = \sigma(w_0)\sigma(w_0^{-1}aw_0)x = \mu(\bar{a})\sigma(w_0)x$ . If

$$\mu(z) = |z|^r \frac{z^m \bar{z}^n}{|z|^{\frac{m+n}{2}}}$$

with  $m + n \geq 0$ ,  $mn = 0$  we set

$$L(s, \omega) = 2(2\pi)^{-(s+r+\frac{m+n}{2})} \Gamma\left(s + r + \frac{m+n}{2}\right).$$

The initial choice of  $\mu$  is of course not uniquely determined. However if  $\mu_0$  is one choice the only other choice is the character  $a \rightarrow \mu_0(\bar{a})$ . Thus the resulting local  $L$ -function is independent of the choice.

The only point to be checked is that the local  $L$ -function behaves properly under induction. We have to verify that if  $\rho$  is a representation of  $\mathbb{C}^* = W_{\mathbb{C}/\mathbb{C}}$  in the class  $\theta$  and

$$\sigma = \text{Ind}(W_{\mathbb{C}/\mathbb{R}}, W_{\mathbb{C}/\mathbb{C}}, \rho)$$

is in the class  $w$  then  $L(s, w) = L(s, \theta)$ . We may as well assume that  $\rho$  is irreducible and therefore one-dimensional. Let it correspond to the generalized character  $\nu$ . If  $\sigma$  is irreducible we could choose the generalized character  $\mu$  above to be  $\nu$  and the equality of the two  $L$ -functions becomes a matter of definition. If  $\sigma$  is irreducible it breaks up into the sum of two one-dimensional representatives. It follows easily that  $\nu(a) = \nu(\bar{a})$  for all  $a$ . Thus  $\nu$  is of the form  $\nu(a) = |a|^r$  and

$$L(s, \theta) = 2(2\pi)^{-(s+r)} \Gamma(s + r).$$

If  $\mu_{\mathbb{R}} = \mu$  is the generalized character  $x \rightarrow |x|^r$  of  $\mathbb{R}^\times$  then  $\nu = \mu_{\mathbb{C}/\mathbb{R}}$  and, as we saw in chapter 10, the representation  $\sigma$  is equivalent to the direct sum of the one-dimensional representations corresponding to  $\mu$  and to  $\mu'$  where  $\mu'(x) = \text{sgn} x \mu(x)$ . Thus

$$L(s, \omega) = \left\{ \pi^{-\frac{1}{2}(s+r)} \Gamma\left(\frac{s+r}{2}\right) \right\} \left\{ \pi^{-\frac{1}{2}(s+r+1)} \Gamma\left(\frac{s+r+1}{2}\right) \right\}.$$

The required result is thus a consequence of the familiar duplication formula

$$2^{2z-1} \Gamma(z) \Gamma(z + 1/2) = \pi^{1/2} \Gamma(2z).$$

If  $F$  is a global field and  $\omega$  is an equivalence class of representations of the Weil group of  $F$ , we define as in the introduction, the global  $L$ -function to be

$$L(s, \omega) = \prod_{\mathfrak{p}} L(s, \omega_{\mathfrak{p}}).$$

I repeat that the product is taken over all primes, including those at infinity. It is not difficult to see that the product converges in a half-plane  $\text{Re } s > c$ . One need only verify it for  $\omega$

irreducible. Choose a Galois extension  $K$  of  $F$  so that there is a representation  $\sigma$  of  $W_{K/F}$  in the class  $\omega$ . The restriction of  $\sigma$  to  $C_K$  is equivalent to the direct sum of 1-dimensional representations corresponding to generalized characters  $\mu^{(1)}, \dots, \mu^{(r)}$  of  $C_K$ . For each  $i$  and  $j$  there is a  $\sigma$  in  $\mathfrak{G}(K/F)$  such that  $\mu^j(a) \equiv \mu^i(\sigma(a))$ . Then  $|\mu_i^{-1} \mu_j(a)| = |\mu^i(a^{-1} \sigma(a))| = 1$  because  $a^{-1} \sigma(a)$  belongs to the compact group of  $i$  idèle classes of norm 1. Let  $|\mu'(a)| = |a|^r$ . Let  $\nu_F$  be the generalized character  $a \rightarrow |a|^r$  of  $C_F$ . Replacing  $\sigma$  by  $\nu_F^{-1} \otimes \sigma$  we replace  $L(s, w_p)$  by  $L(s - r, w_p)$  and  $\mu^{(i)}$  by  $|\mu^{(i)}|^{-1} \mu^{(i)}$ . Thus we may as well suppose that all  $\mu^{(i)}$  are ordinary characters. Since  $C_K$  is of finite index in  $W_{K/F}$  the eigenvalues of  $\sigma(w)$  will all have absolute value 1 for any  $w$  in  $W_{K/F}$  and at any non-archimedean prime the local  $L$ -function will be of the form

$$\prod_{i=1}^s \frac{1}{1 - \alpha_i |\pi_{F_p}|^s}$$

with  $s \leq \dim w$  and  $|\alpha_i| = 1$ ,  $1 \leq i \leq s$ . The required result follows from the well-known fact that

$$\prod^1 \frac{1}{1 - |\pi_{F_p}|^s}$$

converges from  $\operatorname{Re} s > 1$ . This product is taken only over the non-archimedean primes.

## Chapter Twenty-one.

### Proof of the Functional Equation.

Choose a non-trivial character  $\psi_F$  of  $\mathbb{A}_F/F$ . Before we can write down the factor appearing in the functional equation of the global  $L$ -function we have to verify that  $\varepsilon(s, \omega_\gamma, \psi_{F_\gamma}) = 1$  for all but a finite number of  $\gamma$ .

Let  $\omega$  be realized as a representation  $\sigma$  of  $W_{K/F}$  and let the restriction of  $\sigma$  to  $C_K$  be equivalent to the direct sum of 1-dimensional representations corresponding to the generalized characters  $\mu^{(1)}, \dots, \mu^{(r)}$ . All but finitely many primes  $\mathfrak{p}$  will satisfy the following conditions.

- (i)  $\mathfrak{p}$  is non-archimedean.
- (ii)  $n(\psi_{F_{\mathfrak{p}}}) = 1$ .
- (iii)  $\mathfrak{p}$  does not ramify in  $K$ .
- (iv)  $m(\mu_{\mathfrak{P}}^{(i)}) = 0$  for all  $\mathfrak{P}$  dividing  $\mathfrak{p}$  and all  $i$ .

Choose one such  $\mathfrak{p}$  and let  $\mathfrak{P}$  divide  $\mathfrak{p}$ . Corresponding to the map  $K/F \rightarrow K_{\mathfrak{P}}/F_{\mathfrak{p}}$  is a map  $\varphi_{\mathfrak{p}} : W_{K_{\mathfrak{P}}/F_{\mathfrak{p}}} \rightarrow W_{K/F}$ .  $\omega_{\mathfrak{p}}$  is the class of  $\sigma_{\mathfrak{p}} = \sigma \circ \varphi_{\mathfrak{p}}$ . The kernel of  $\sigma_{\mathfrak{p}}$  contains  $U_{K_{\mathfrak{P}}}$ . Since  $K_{\mathfrak{P}}/F_{\mathfrak{p}}$  is unramified the quotient of  $W_{K_{\mathfrak{P}}/F_{\mathfrak{p}}}$  by  $U_{K_{\mathfrak{P}}}$  is abelian and  $\sigma_{\mathfrak{p}}$  is the direct sum of one-dimensional representations. Let them correspond to the generalized characters  $\nu_{\mathfrak{p}}^{(1)}, \dots, \nu_{\mathfrak{p}}^{(r)}$  of  $C_{F_{\mathfrak{p}}}$ . Since  $\tau_{K_{\mathfrak{P}}/F_{\mathfrak{p}}}$  takes  $U_{K_{\mathfrak{P}}}$  onto  $U_{F_{\mathfrak{p}}}$  each of these characters is unramified. Thus

$$\varepsilon(s, \omega_{\mathfrak{p}}, \psi_{F_{\mathfrak{p}}}) = \prod_{i=1}^r \Delta \left( \alpha_{F_{\mathfrak{p}}}^{s-\frac{1}{2}} \nu_{\mathfrak{p}}^{(i)}, \psi_{F_{\mathfrak{p}}} \right) = 1.$$

If  $\psi'_F$  is another non-trivial character of  $\mathbb{A}_F/F$  there is a  $\beta$  in  $F^*$  such that  $\psi'_F(x) \equiv \psi_F(\beta x)$ . According to Lemma 5.1

$$\varepsilon(s, \omega, \psi_{F_{\mathfrak{p}}}) = \alpha_{F_{\mathfrak{p}}}^{s-\frac{1}{2}}(\beta) \det \omega_{\mathfrak{p}}(\beta) \varepsilon(s, \omega, \psi_{F_{\mathfrak{p}}}).$$

Since

$$\prod_{\mathfrak{p}} \alpha_{F_{\mathfrak{p}}}(\beta)^{s-\frac{1}{2}} \det \omega_{\mathfrak{p}}(\beta) = |\beta|^{s-\frac{1}{2}} \det \omega(\beta) = 1$$

the function

$$\varepsilon(s, \omega) = \prod_{\mathfrak{p}} \varepsilon(s, \omega_{\mathfrak{p}}, \psi_{F_{\mathfrak{p}}})$$

is indeed independent of  $\psi_F$ .

We can infer from Tate's thesis not only that  $L(s, \omega)$  is meromorphic in the whole complex plane if  $\omega$  is one-dimensional but also that it satisfies the functional equation

$$L(s, \omega) = \varepsilon(s, \omega) L(1 - s, \tilde{\omega})$$

if  $\tilde{\omega}$  is contragredient to  $\omega$ . As is well-known, Lemma 2.2 then implies that  $L(s, \omega)$  is meromorphic in the whole complex plane for any  $\omega$ . In any case, Theorem B is true for one-dimensional  $\omega$  and, granting this, we have to establish it in general.

First we need a lemma.

**Lemma 21.1**

*Suppose  $F$  is a global field,  $K$  is a Galois extension of  $F$ ,  $E$  is a field lying between  $F$  and  $K$ ,  $\chi$  is a generalized character of  $C_E$  and*

$$\sigma = \text{Ind}(W_{K/F}, W_{K/E}, \chi).$$

*If  $\omega$  is the class of  $\sigma$  and, for each prime  $\mathfrak{q}$  of  $E$ ,  $\chi_{\mathfrak{q}}$  is the restriction of  $\chi$  to  $C_{E_{\mathfrak{q}}}$  then for each prime  $\mathfrak{p}$  of  $F$*

$$\varepsilon(s, \omega_{\mathfrak{p}}, \psi_{F_{\mathfrak{p}}}) = \prod_{\mathfrak{q}|\mathfrak{p}} \{\varepsilon(s, \chi_{\mathfrak{q}}, \psi_{E_{\mathfrak{q}}/F_{\mathfrak{p}}}) \rho(E_{\mathfrak{q}}/F_{\mathfrak{p}}, \psi_{F_{\mathfrak{p}}})\}.$$

Let  $\mathfrak{P}$  be a prime of  $K$  dividing  $\mathfrak{p}$ . The first step is to find a set of representatives for the double cosets  $W_{K/E} w W_{K_{\mathfrak{P}}/F_{\mathfrak{p}}}$ . Since  $C_K \subseteq W_{K/E}$  is a normal subgroup of  $W_{K/F}$  we can factor out  $C_K$  and merely find a set of representatives for the double cosets

$$\mathfrak{G}(K/E) \sigma \mathfrak{G}(K_{\mathfrak{P}}/F_{\mathfrak{p}}).$$

Let  $\mathfrak{P}_1, \dots, \mathfrak{P}_r$  be the primes of  $K$  dividing  $\mathfrak{p}$  and let  $\mathfrak{P}_1$  divide  $\mathfrak{q}_i$  in  $E$ .  $\mathfrak{G}(K/F)$  is the disjoint union

$$\bigcup_{i=1}^r \sigma_i \mathfrak{G}(K_{\mathfrak{P}_i}/F_{\mathfrak{p}})$$

where  $\sigma_i(\mathfrak{P}) = \mathfrak{P}_i$ . If  $\sigma_i$  and  $\sigma_j$  belong to the same double coset  $\mathfrak{q}_i = \mathfrak{q}_j$ . Conversely, if  $\mathfrak{q}_i = \mathfrak{q}_j$  there is a  $\rho$  in  $\mathfrak{G}(K/E)$  such that  $\rho(\mathfrak{P}_i) = \mathfrak{P}_j$ . Then  $\rho\sigma_i(\mathfrak{P}) = \sigma_j(\mathfrak{P})$  and

$$\rho\sigma_i \in \sigma_j \mathfrak{G}(K_{\mathfrak{P}_j}/F_{\mathfrak{p}}).$$

Thus we may write  $\mathfrak{G}(K/F)$  as the disjoint union

$$\bigcup_{\tau \in S} \mathfrak{G}(K/E) \tau \mathfrak{G}(K_{\mathfrak{P}}/F_{\mathfrak{p}})$$

so that if  $\mathfrak{P}$  divides  $\mathfrak{q}$  in  $E$  the collection  $\{\tau(\mathfrak{q}) \mid \tau \in S\}$  is the collection of distinct primes in  $E$  dividing  $\mathfrak{p}$ .

For each  $\tau$  in  $S$  choose a representative  $w(\tau)$  in  $W_{K/F}$ . For each  $\tau$  in  $S$  the restriction of  $\sigma$  to  $W_{K_{\mathfrak{P}}/F_{\mathfrak{p}}}$  leaves invariant the space of functions  $f$  on the double coset  $W_{K/E}w(\tau)W_{K_{\mathfrak{P}}/F_{\mathfrak{p}}}$  which satisfy  $f(vw) = \chi(\tau_{K/E}(v))f(w)$  for all  $v$  in  $W_{K/E}$ . The representation of  $W_{K_{\mathfrak{P}}/F_{\mathfrak{p}}}$  on this space is equivalent to

$$\text{Ind}(W_{K_{\mathfrak{P}}/F_{\mathfrak{p}}}, W_{K_{\mathfrak{P}}/E_{\mathfrak{q}}^{\tau}}, \chi'_{\mathfrak{q}^{\tau}})$$

if  $E^{\tau} = \tau^{-1}(E)$  and

$$\chi'_{\mathfrak{q}^{\tau}}(a) = \chi(\tau(a)).$$

Thus

$$\varepsilon(s, \omega_{\mathfrak{q}}, \psi_{F_{\mathfrak{p}}}) = \prod_{\tau \in S} \varepsilon(s, \chi'_{\mathfrak{q}^{\tau}}, \psi_{E_{\mathfrak{q}}^{\tau}/F_{\mathfrak{p}}}) \rho(E_{\mathfrak{q}}^{\tau}/F_{\mathfrak{p}}, \psi_{F_{\mathfrak{p}}})$$

which is of course equal to

$$\prod_{\tau \in S} \varepsilon(s, \chi_{\mathfrak{q}}, \psi_{E_{\mathfrak{q}}/F_{\mathfrak{p}}}) \rho(E_{\mathfrak{q}}/F_{\mathfrak{p}}, \psi_{F_{\mathfrak{p}}}).$$

We set

$$\rho(E/F) = \prod_{\mathfrak{q}} \prod_{\mathfrak{q}|\mathfrak{p}} \rho(E_{\mathfrak{q}}/F_{\mathfrak{p}}, \psi_{F_{\mathfrak{p}}}).$$

The preceding discussion together with Lemma 5.1 shows that it does not depend on  $\psi_F$ . However that does not really matter since we are about to show that for any choice of  $\psi_F$  it is 1. Observe first of all that the previous lemma implies immediately that if  $\omega$  is the class of

$$\sigma = \text{Ind}(W_{K/F}, W_{K/E}, \chi)$$

then

$$\varepsilon(s, \omega) = \varepsilon(s, \chi) \rho(E/F).$$

Given an arbitrary class  $\omega$  realizable as a representation of  $W_{K/F}$  we can find fields  $E_1, \dots, E_r$  lying between  $F$  and  $K$ , generalized characters  $\chi_{E_1}, \dots, \chi_{E_r}$ , and integers  $m_1, \dots, m_r$  such that

$$\sum_{i=1}^r \oplus m_i \text{Ind}(W_{K/F}, W_{K/E_i}, \chi_{E_i})$$

is in the class  $\omega$ . Then

$$\varepsilon(s, \omega) = \prod_{i=1}^r \{\varepsilon(s, \chi_{E_i})^{m_i} \rho(E_i/F)^{m_i}\}.$$

On the other hand

$$L(s, \omega) = \prod_{i=1}^r L(s, \chi_{E_i})^{m_i}$$

and

$$L(s, \tilde{\omega}) = \prod_{i=1}^r L(s, \chi_{E_i}^{-1})^{m_i}.$$

Since

$$L(s, \chi_{E_i}) = \varepsilon(s, \chi_{E_i}) L(1-s, \chi_{E_i}^{-1})$$

we have

$$L(s, \omega) = \prod_{i=1}^r \varepsilon(s, \chi_{E_i})^{m_i} L(1-s, \tilde{\omega})$$

because  $\tilde{\omega}$  contains

$$\sum_{i=1}^r \oplus m_i \operatorname{Ind}(W_{K/F}, W_{K/E_i}, \chi_{E_i}^{-1}).$$

Consequently

$$\prod_{i=1}^r \varepsilon(s, \chi_{E_i})^{m_i}$$

depends only on  $\omega$  and not on the particular way it is written as a sum of induced representations. Thus

$$\prod_{i=1}^r \rho(E_i/F)^{m_i}$$

also depends only on  $\omega$ . We call it  $H(\omega)$ . It is clear that to prove Theorem B we have to show that  $H(\omega) = 1$  for all  $\omega$  or, what is the same, that  $\rho(E/F) = 1$  for all  $E$  and  $F$ .

Suppose  $F \subseteq E \subseteq E'$ . Denote the primes of  $F$  by  $\mathfrak{p}$ , those of  $E$  by  $\mathfrak{q}$ , and those of  $E'$  by  $\mathfrak{q}'$ . Then

$$\rho(E'/F) = \prod_{\mathfrak{p}} \prod_{\mathfrak{q}'|\mathfrak{p}} \rho(E'_{\mathfrak{q}'}/F_{\mathfrak{p}}, \psi_{F_{\mathfrak{p}}}).$$

Apply Lemma 4.5 to see that the right side equals

$$\prod_{\mathfrak{p}} \prod_{\mathfrak{q}|\mathfrak{p}} \prod_{\mathfrak{q}'|\mathfrak{q}} \left\{ \rho(E'_{\mathfrak{q}'}/E_{\mathfrak{q}}, \psi_{F_{\mathfrak{q}}/F_{\mathfrak{p}}}) \rho(E_{\mathfrak{q}}/F_{\mathfrak{p}}, \psi_{F_{\mathfrak{p}}})^{[E'_{\mathfrak{q}}:E_{\mathfrak{q}}]} \right\}.$$

Since

$$\sum_{\mathfrak{q}'|\mathfrak{q}} [E'_{\mathfrak{q}'} : E_{\mathfrak{q}}] = [E' : E]$$

this may be written as

$$\left\{ \prod_{\mathfrak{q}} \prod_{\mathfrak{q}'|\mathfrak{q}} \rho(E'_{\mathfrak{q}'}/E_{\mathfrak{q}}, \psi_{F_{\mathfrak{q}}/F_{\mathfrak{p}}}) \right\} \left\{ \prod_{\mathfrak{p}} \prod_{\mathfrak{q}|\mathfrak{p}} \rho(E_{\mathfrak{q}}/F_{\mathfrak{p}}, \psi_{F_{\mathfrak{p}}}) \right\}^{[E':E]}$$

which is of course

$$\rho(E'/E) \rho(E/F)^{[E':E]}. \quad (20.1)$$

Suppose  $E/F$  is an abelian extension and  $\omega$  is the class of the representation of  $W_{E/F}$  induced from the trivial representation of  $C_E = W_{E/E}$ . Then  $H(\omega) = \rho(E/F)$ . On the other hand,  $\omega$  is the direct sum of  $[E : F]$  one-dimensional representations; so  $H(\omega) = \rho(F/F)^{[E:F]} = 1$ . It follows immediately not only that  $\rho(E/F) = 1$  if  $E/F$  is abelian but also that  $\rho(E/F) = 1$  if  $E$  can be obtained from  $F$  by a succession of abelian extensions. In particular if  $F \subseteq E \subseteq L$  and  $L/F$  is nilpotent  $\rho(E/F) = 1$ .

Observe that (20.1) together with Lemma 2.2 and the transitivity of induction imply that if  $\omega$  is the class of

$$\sigma = \text{Ind}(W_{K/F}, W_{K/E}, \rho)$$

and  $\theta$  is the class of  $\rho$  then

$$H(\omega) = H(\theta) \rho(E/F)^{\dim \theta}.$$

To complete the proof we will show that  $H(\omega_1 \otimes \omega_2) = H(\omega_2)^{\dim \omega_1}$  for all  $\omega_1$  and  $\omega_2$ . Taking  $\omega_2 = 1$  we find  $H(\omega_1) = 1$ . It is enough to prove the equality when  $\omega_1$  and  $\omega_2$  are both realizable as representations of  $W_{K/F}$  and there is a field  $E$  lying between  $E$  and  $K$  with  $\mathfrak{G}(K/E)$  nilpotent and a generalized character  $\chi_E$  such that  $\omega_2$  is the class of

$$\text{Ind}(W_{K/F}, W_{K/E}, \chi_E).$$

Then  $H(\omega_2) = \rho(E/F)$ . If  $\rho$  is a representation in the restriction of  $\omega_1$  to  $W_{K/E}$  then, by Lemma 2.3,  $\omega_1 \otimes \omega_2$  is the class of

$$\text{Ind}(W_{K/F}, W_{K/E}, \rho \otimes \chi_E).$$

Let  $\theta$  be the class of  $\rho \otimes \chi_E$ .  $H(\theta)$  is of the form

$$\prod_{i=1}^r \rho(E_i/E)^{m_i}$$

where  $E \subseteq E_i \subseteq K$  and is therefore 1. Thus

$$H(\omega_1 \otimes \omega_2) = H(\theta) \rho(E/F)^{\dim \theta} = \rho(E/F)^{\dim \omega_1}.$$

as required.

## Chapter Twenty-two.

### Appendix.

There is clearly not much to be said about the functions  $\varepsilon(s, \omega, \psi_F)$  when  $F$  is archimedean. However for non-archimedean  $F$  their properties are more obscure. In this appendix we shall describe and prove some properties which were not needed in the proofs of the main theorems and so found no place in the main body of the paper but which will be used elsewhere.

The first step is to define the Artin conductor of  $\omega$ . We follow a well-trodden path. If  $K$  is a finite Galois extension of the local field  $F$  then  $W_{K/F}^0$  contains  $U_K$  as a subgroup of finite index and is therefore compact. It is, in fact, a maximal compact subgroup of  $W_{K/F}$ . Choose that Haar measure  $dw$  on  $W_{K/F}$  which assigns the measure 1 to  $W_{K/F}^0$ . If  $f$  is a locally constant function on  $W_{K/F}$  and  $u$  is a non-negative real number set

$$\hat{f}(u) = \left\{ \int_{W_{K/F}^u} dw \right\}^{-1} \int_{W_{K/F}^u} \{f(1) - f(w)\} dw.$$

Since  $W_{K/F}^u$  is an open subgroup of  $W_{K/F}$  it is meaningful to restrict  $dw$  to it.  $\hat{f}(u)$  is bounded, continuous from the left, and 0 for  $u$  sufficiently large. Since  $W_{K/F}^u = W_{K/F}^0$  for  $1 < u \leq 0$  we have  $\hat{f}(u) = \hat{f}(0)$  for such  $u$ . The integral

$$\int_{-1}^{\infty} \hat{f}(u) du$$

is well-defined.

There are some simple lemmas to be verified.

#### Lemma 22.1

Suppose  $F \subseteq K \subseteq L$  and  $L/F$  is also a Galois extension. Define  $g$  on  $W_{L/F}$  by  $g(w) = f(\tau_{L/F, K/F}(w))$ . Then  $\hat{g}(u) = \hat{f}(u)$  for all  $u$ .

This is immediate because by Lemma 6.16,  $\tau_{L/F, K/F}$  maps  $W_{L/F}^u$  onto  $W_{K/F}^u$  for every  $u$ .

When we want to make the roles of  $K$  and  $F$  explicit we write  $\hat{f}(u) = \hat{f}_{K/F}(u)$ .

#### Lemma 22.2

Suppose  $F \subseteq E \subseteq K$  and  $g$  is a function on  $W_{K/E}$  satisfying  $g(wzw^{-1}) = g(z)$  for all  $z$  and  $w$  in  $W_{K/E}$ . Regard  $W_{K/E}$  as a subgroup of  $W_{K/F}$  and set

$$f(w) = \sum_{z \in W_{K/E} \setminus W_{K/F}} g(z^{-1}wz).$$

If  $N_{E/F} \pi_E$  is a unit times  $\pi_F^{f_{E/F}}$  and  $\mathfrak{P}_E^{\delta_{E/F}}$  is the different of  $E/F$

$$\int_{-1}^{\infty} \hat{f}_{K/F}(u) du = f_{E/F} \int_{-1}^{\infty} \hat{g}_{K/E}(u) du + f_{E/F} \delta_{E/F} g(1).$$

Let  $dw_{K/F}$  be the normalized Haar measure on  $W_{K/F}$  and let  $dw_{K/E}$  be the normalized Haar measure on  $W_{K/E}$ . On  $W_{K/E}$

$$dw_{K/E} = [W_{K/F}^0 : W_{K/E}^0] dw_{K/F}.$$

Suppose at first that  $g(1) = 0$ . Denote also by  $g$  the function on  $W_{K/F}$  which equals the given  $g$  on  $W_{K/E}$  but is 0 outside of  $W_{K/E}$ . Then

$$\hat{f}_{K/F}(u) = [W_{K/F} : W_{K/E}] \hat{g}_{K/F}(u).$$

Since  $W_{K/F}^u \cap W_{K/E} = W_{K/E}^v$  if  $v = \psi_{E/F}(u)$

$$\begin{aligned} \hat{g}_{K/F}(u) &= -[W_{K/F}^0 : W_{K/F}^u] \int_{W_{K/F}^u} g(w) dw_{K/F} \\ &= -\frac{[W_{K/F}^0 : W_{K/F}^u]}{[W_{K/F}^0 : W_{K/E}^0]} \int_{W_{K/E}^v} g(w) dw_{K/E} \\ &= \frac{1}{[W_{K/F}^0 : W_{K/E}^0]} \frac{[W_{K/F}^0 : W_{K/F}^u]}{[W_{K/E}^0 : W_{K/E}^v]} \hat{g}_{K/E}(v). \end{aligned}$$

Recall that

$$f_{E/F} = \frac{[W_{K/F} : W_{K/E}]}{[W_{K/F}^0 : W_{K/E}^0]}.$$

Moreover

$$\frac{[W_{K/F}^0 : W_{K/F}^u]}{[W_{K/E}^0 : W_{K/E}^v]} = \frac{[W_{K/F}^0 : W_{K/F}^u U_K^0]}{[W_{K/E}^0 : W_{K/E}^v U_K^0]} \cdot \frac{[U_K^0 : U_K^0 \cap W_{K/F}^u]}{[U_K^0 : U_K^0 \cap W_{K/E}^v]}$$

and  $U_K^0 \cap W_{K/F}^u = U_K^0 \cap W_{K/E}^v$ . By Lemma 6.11 the first term in this product is equal to

$$\frac{[G^0 : G^u]}{[H^0 : H^v]}$$

if  $G = \mathfrak{G}(K/F)$  and  $H = \mathfrak{G}(K/E)$ . But

$$[G^0 : G^u] = \psi'_{K/F}(u)$$

and

$$[H^0 : H^v] = \psi'_{K/E}(v)$$

while

$$\psi'_{K/F}(u) = \psi'_{K/E}(v) \psi'_{E/F}(u).$$

Thus

$$\begin{aligned} \int_{-1}^{\infty} \hat{f}_{K/F}(u) du &= f_{E/F} \int_{-1}^{\infty} \hat{g}_{K/E}(\psi_{E/F}(u)) \psi'_{E/F}(u) du \\ &= f_{E/F} \int_{-1}^{\infty} \hat{g}_{K/E}(v) dv. \end{aligned}$$

To complete the proof of the lemma, we have to show that if  $g(w) = 1$  so that  $\hat{g}_{K/E}(u) \equiv 0$  then

$$\int_{-1}^{\infty} \hat{f}_{K/F}(u) du = f_{E/F} \delta_{E/F}.$$

In this case

$$\hat{f}_{K/F}(u) = [G : H] - \frac{[G : H]}{[G^0 : H^0]} \frac{[G^0 : G^u]}{[H^0 : H^v]}$$

if  $v = \psi_{E/F}(u)$ . After some simple rearranging this becomes

$$\frac{[G : H]}{[G^u : 1]} \{[G^u : 1] - [H^v : 1]\} = \frac{[G : H]}{[G^u : 1]} \{([G^u : 1] - 1) - ([H^v : 1] - 1)\}.$$

The factor

$$\frac{[G : H]}{[G^u : 1]} = \frac{[G : G^0]}{[H : 1]} \psi'_{K/F}(u)$$

and, from paragraph IV.2 of [ ],

$$\int_1^{\infty} ([G^u : 1] - 1) \psi'_{K/F}(u) du = \int_{-1}^{\infty} ([G_x : 1] - 1) dx = \delta_{K/F}$$

while

$$\int_{-1}^{\infty} ([H^v : 1] - 1) \psi'_{K/F}(u) du = \int_{-1}^{\infty} ([H^v : 1] - 1) \psi'_{K/E}(v) dv = \delta_{K/E}.$$

Thus

$$\int_{-1}^{\infty} \hat{f}_{K/F}(u) du = \frac{[G : G^0]}{[H : 1]} (\delta_{K/F} - \delta_{K/E}) = f_{E/F} \delta_{E/F}$$

because

$$\delta_{K/F} = \delta_{K/E} + [H_0 : 1] \delta_{E/F}.$$

Suppose  $\omega$  is an equivalence class of representations of the Weil group of  $F$  and  $\sigma$  is a representation of  $W_{K/F}$  in the class of  $\omega$ . Let  $f_\sigma$  be the character of  $\sigma$ . It follows from Lemma 22.1 that the value of

$$\int_{-1}^{\infty} \hat{f}_\sigma(u) du$$

depends only on  $\omega$  and not on  $\sigma$ . We call it the order of  $\omega$  and denote it by  $m(\omega)$ . Since  $\hat{f}_\sigma(u)$  is clearly non-negative for all  $u$  and vanishes identically if and only if  $W_{K/F}^0$  is contained in the kernel of  $\sigma$ , the order  $m(\omega)$  is always non-negative and equals zero if and only if the kernel of each realization  $\sigma$  of  $\omega$  contains  $W_{K/F}^0$ .

### Lemma 22.3

(a) If  $\omega = \omega_1 \oplus \omega_2$  then  $m(\omega) = m(\omega_1) + m(\omega_2)$ .

(b) If

$$\omega = \text{Ind}(W_{K/F}, W_{K/E}, \nu)$$

then

$$m(\omega) = f_{E/F} m(\nu) = f_{E/F} \delta_{E/F} \dim \nu.$$

(c)  $m(\omega)$  is a non-negative integer.

The first property is immediate. The second is a consequence of Lemma 22.2. To verify the third we merely have to show that  $m(\omega)$  is integral. If  $\omega = \mu \oplus \nu$  and the assertion is true for any two of  $\mu, \nu$  and  $\omega$  it is true for the third. This observation, together with part (b) and Lemma 2.2, shows that it is enough to verify (c) when  $\omega$  is the one-dimensional class corresponding to a generalized character  $\chi_F$  of  $C_F$ . To do this we show that  $m(\omega) = m(\chi_F)$ .

If  $f(a) = \chi_F(a)$  for  $a$  in  $C_F = W_{F/F}$  then  $\hat{f}(u) = \hat{f}(m)$  for  $m - 1 < u \leq m$  and

$$\hat{f}(m) = [U_F^0 : U_F^m] \int_{U_F^m} \{1 - \chi_F(a)\} da.$$

The right side is 1 if  $m < m(\chi_F)$  and 0 if  $m \geq m(\chi_F)$ . Thus

$$m(\omega) = \int_{-1}^{m(\chi_F)-1} du = m(\chi_F).$$

The function  $\omega \rightarrow m(\omega)$  is characterized by (a) and (b) together with the fact that  $m(\omega) = m(\chi_F)$  if  $\omega$  is the class of  $\chi_F$ .

#### Lemma 22.4

*If  $\omega$  is an equivalence class of representations of the Weil group of the non-archimedean local field  $F$  and  $\psi_F$  is a non-trivial additive character of  $F$  set  $m'(\omega) = m(\omega) + n(\psi_F) \dim \omega$ . There is a non-zero complex constant  $a(\omega)$  such that, as a function of  $s$ ,*

$$\varepsilon(s, \omega, \psi_F) = a(\omega) |\pi_F|^{m'(\omega)s}.$$

If  $\omega = \mu \oplus \nu$  and the lemma is true for any two of  $\mu, \nu$ , and  $\omega$ , it is true for the third. Applying Lemma 2.2 we see that it is enough to verify it when  $\omega$  contains a representation

$$\text{Ind}(W_{K/F}, W_{K/E}, \chi_E).$$

Then

$$\varepsilon(s, \omega, \psi_F) = \Delta(\alpha_E^{s-\frac{1}{2}} \chi_E, \psi_{E/F}) \rho(E/F, \psi_F).$$

Clearly

$$\Delta(\alpha_E^{s-\frac{1}{2}} \chi_E, \psi_{E/F}) = \alpha_E^{s-\frac{1}{2}} \left( \pi_E^{m(\chi_E)+\delta_{E/F}} \pi_F^{n(\psi_F)} \right) \Delta(\chi_E, \psi_{E/F}).$$

But

$$\alpha_E \left( \pi_E^{m(\chi_E)+\delta_{E/F}} \pi_F^{n(\psi_F)} \right) = \alpha_F \left( N_{E/F} \left( \pi_E^{m(\chi_E)+\delta_{E/F}} \pi_F^{n(\psi_F)} \right) \right)$$

and the argument on the right is the product of a unit and

$$\pi_F^{f_{E/F}(m(\chi_E)+\delta_{E/F})+n(\psi_F) \dim \omega} = \pi_F^{m'(\omega)}.$$

The lemma follows.

The next lemma is rather technical and to prove it we will have to use the notations and results of paragraphs 8 and 9.

#### Lemma 22.5

Let  $\omega$  be an equivalence class of representations of the Weil group of the non-archimedean local field  $F$  and  $m_1$  a positive integer. There is a positive integer  $m_2$  such that if  $\chi_F$  and  $\mu_1, \dots, \mu_r$  with  $r = \dim \omega$ , are generalized characters of  $C_F$  and  $m(\chi_F) \geq m_2$ ,  $m(\mu_i) \leq m_1$ ,  $1 \leq i \leq r$ , while

$$\prod_{i=1}^r \mu_i = \det \omega$$

then for any non-trivial additive character  $\psi_F$

$$\varepsilon(s, \chi_F \otimes \sigma, \psi_F) = \prod_{i=1}^r \varepsilon(s, \mu_i \chi_F, \psi_F).$$

Choose, as a start,  $m_2 \geq 2m_1 + 1$ . If  $\mu_F$  is a generalized character of  $C_F$  and  $m(\mu_F) \leq m_1$  while  $m(\chi_F) \geq m_2$  then  $m(\mu_F \chi_F) = m(\chi_F) = m$ . Let  $n = n(\psi_F)$  and choose  $\gamma$  so that  $O_F \gamma = \mathfrak{P}_F^{m+n}$ . If  $\beta = \beta(\chi_F)$  we may choose  $\beta(\mu_F \chi_F) = \beta$ . Appealing to Lemmas 8.1 and 9.4 we see that

$$\begin{aligned} \varepsilon(s, \mu_F \chi_F, \psi_F) &= \Delta(\alpha_F^{s-\frac{1}{2}} \mu_F \chi_F, \psi_F) \\ &= (\alpha_F^{s-\frac{1}{2}} \mu_F) \left( \frac{\gamma}{\beta} \right) \Delta(\chi_F, \psi_F). \end{aligned}$$

In particular

$$\prod_{i=1}^r \varepsilon(s, \mu_i \chi_F, \psi_F) = \alpha_F^{r(s-\frac{1}{2})} \left( \frac{\gamma}{\beta} \right) \det \omega \left( \frac{\gamma}{\beta} \right) \{\Delta(\chi_F, \psi_F)\}^r.$$

If  $\omega = \mu \oplus \nu$  then

$$\varepsilon(s, \chi_F \otimes \omega, \psi_F) = \varepsilon(s, \chi_F \otimes \mu, \psi_F) \varepsilon(s, \chi_F \otimes \nu, \psi_F)$$

and all three terms are different from zero. Thus if the lemma is true for two of  $\mu, \nu$  and  $\omega$  it is true for the third. Using Lemma 2.2 once again, we see that it is enough to prove the lemma when there is an intermediate field  $E$  and a generalized character  $\mu_E$  of  $C_E$  such that  $\omega$  is the class of

$$\text{Ind}(W_{K/F}, W_{K/E}, \mu_E).$$

Then  $\chi_F \otimes \omega$  is the class of

$$\text{Ind}(W_{K/F}, W_{K/E}, \mu_E \chi_{E/F})$$

and

$$\varepsilon(s, \chi_F \otimes \omega, \psi_F) = \Delta(\alpha_E^{s-\frac{1}{2}} \mu_E \chi_{E/F}, \psi_{E/F}) \rho(E/F, \psi_F).$$

There are two simple lemmas which we need before we can proceed further and we digress to prove them.

**Lemma 22.6**

Let  $E$  be a separable extension of  $F$ . If  $m$  is sufficiently large

$$\psi_{E/F}(m-1) + 1 = m e_{E/F} - \delta_{E/F}$$

if  $e_{E/F}$  is the index of ramification of  $F$  in  $E$ .

Suppose  $F \subseteq E \subseteq K$  where  $K/F$  is Galois and the assertion is true for  $K/F$  and  $K/E$ . Subtracting 1 from both sides of the equation, applying  $\psi_{K/E}$ , and then adding 1, we obtain the equivalent equation

$$\psi_{K/F}(m-1) + 1 = \psi_{K/E}(m e_{E/F} - \delta_{E/F} - 1) + 1.$$

By assumption, the left side equals

$$m e_{K/F} - \delta_{K/F}$$

and the right side equals

$$(m e_{E/F} - \delta_{E/F}) e_{K/E} - \delta_{K/E}.$$

Since  $e_{K/F} = e_{K/E} e_{E/F}$  and  $\delta_{K/F} = \delta_{K/E} + e_{K/E} \delta_{E/F}$  these two expressions are equal and we have only to prove the lemma for Galois extensions.

Suppose  $F \subseteq K \subseteq L$  and  $L/F$  and  $K/F$  are Galois. Suppose also that the lemma is true for  $L/K$  and  $K/F$ . Then

$$\begin{aligned} \psi_{L/F}(m-1) + 1 &= \psi_{L/F}(\psi_{K/F}(m-1)) + 1 \\ &= \psi_{L/F}(m e_{K/F} - \delta_{K/F} - 1) + 1 \\ &= (m e_{K/F} - \delta_{K/F}) e_{L/K} - \delta_{L/K} \\ &= m e_{L/F} - \delta_{L/F} \end{aligned}$$

as before. Thus, if we use induction, we need only verify the lemma directly for a Galois extension  $K/F$  of prime degree.

We apply Lemma 6.3. If  $K/F$  is unramified,  $e_{K/F} = 1$  and  $\delta_{K/F} = 0$  while  $\psi_{K/F}(m-1) = m-1$ ; so the relation follows. If  $K/F$  is ramified there is an integer  $t$  such that  $\delta_{K/F} = ([K:F] - 1)(t+1)$  while  $\psi_{K/F}(m-1) + 1 = [K:F]m - ([K:F] - 1)(t+1)$  for  $m-1 \geq t$ . Since  $e_{K/F} = [K:F]$  the relation follows again.

If  $n = n(\psi_F)$  then

$$n' = n(\psi_{E/F}) = n e_{E/F} + \delta_{E/F}.$$

Thus if  $m$  is sufficiently large and  $m' = \psi_{E/F}(m - 1) + 1$

$$m' + n' = (m + n) e_{E/F}$$

and if  $O_F \gamma = \mathfrak{P}_F^{m+n}$  then  $O_E \gamma = \mathfrak{P}_E^{m'+n'}$ . We define

$$P_{E/F}^*(x) = P_{E/F}^*(x; \gamma, \gamma)$$

as in paragraph 8.

**Lemma 22.7**

*If  $m_1$  is a given positive integer then for  $m$  sufficiently large*

$$P_{E/F}^*(x) \equiv x \pmod{\mathfrak{P}_E^{m_1}}.$$

As in paragraph 8, let  $d$  be the integral part of  $\frac{m}{2}$ ,  $d'$  the integral part of  $\frac{m'}{2}$ , and let  $m = 2d + \varepsilon$ ,  $m' = 2d' + \varepsilon'$ .  $P_{E/F}^*(x)$  depends only on the residue of  $x$  modulo  $\mathfrak{P}_F^d$  and is only determined modulo  $\mathfrak{P}_E^{d'}$ . Recall that if

$$P_{E/F}(y) = N_{E/F}(1 + y) - 1$$

for  $y$  in  $\mathcal{P}_E^{d'+\varepsilon'}$  then

$$\psi_{E/F} \left( \frac{P_{E/F}^*(x)y}{\gamma} \right) = \psi_F \left( \frac{x P_{E/F}(y)}{\gamma} \right).$$

To show that  $P_{E/F}^*(x) \equiv x \pmod{\mathfrak{P}_E^{m_1}}$  when  $m$  is sufficiently large, we have to show that

$$\psi_F \left( \frac{x P_{E/F}(y)}{\gamma} \right) = \psi_{E/F} \left( \frac{xy}{\gamma} \right)$$

for  $y$  in  $\mathfrak{P}_E^{m'-m_1}$ . To do this we show that

$$P_{E/F}(y) \equiv S_{E/F}(y) \pmod{\mathfrak{P}_F^m}$$

when  $m$  is sufficiently large and  $y$  is in  $\mathfrak{P}_E^{m'-m_1}$ .

To put it another way, we have to show that if  $K/F$  is any Galois extension the assertion is true for all intermediate fields  $E$ . For this we use induction on  $[K : F]$  together with Lemma 3.3. There are three facts to verify:

- (i) If  $E/F$  is a Galois extension of prime degree then

$$P_{E/F}(y) \equiv S_{E/F}(y) \pmod{\mathfrak{P}_F^m}$$

when  $m$  is sufficiently large and  $y$  is in  $\mathfrak{P}_E^{m'-m_1}$ .

- (ii) Suppose  $F \subseteq E \subseteq K$  and  $K/F$  is Galois. Let  $G = \mathfrak{G}(K/F)$  and let  $E$  be the fixed field of  $H$ . Suppose  $H \neq \{1\}$  and  $G = HC$  where  $H \cap C = \{1\}$  and  $C$  is a non-trivial abelian normal subgroup of  $G$  which is contained in every other non-trivial normal subgroup. If the induction assumption is valid

$$P_{E/F}(y) \equiv S_{E/F}(y) \pmod{\mathfrak{P}_F^m}$$

when  $m$  is sufficiently large and  $y$  is in  $\mathfrak{P}_E^{m'-m_1}$ .

- (iii) Suppose  $F \subseteq E \subseteq E' \subseteq K$  and  $m'' = \psi_{E'/F}(m-1) + 1$ . If, for any choice of  $m_1$ ,

$$P_{E/F}(y) \equiv S_{E/F}(y) \pmod{\mathfrak{P}_F^m}$$

when  $m$  is sufficiently large and  $y$  is in  $\mathfrak{P}_E^{m'-m_1}$  and, for any choice of  $m'_1$ ,

$$P_{E'/E}(y) \equiv S_{E'/E}(y) \pmod{\mathfrak{P}_E^{m'_1}}$$

when  $m$ , or  $m'$ , is sufficiently large and  $y$  is in  $\mathfrak{P}_{E'}^{m''-m'_1}$  then, for any choice of  $m'_1$ ,

$$P_{E'/F}(y) \equiv S_{E'/F}(y) \pmod{\mathfrak{P}_F^m}$$

if  $m$  is sufficiently large and  $y$  is in  $\mathfrak{P}_{E'}^{m''-m'_1}$ .

We first verify (i) for  $E/F$  unramified. By paragraph V.2 of [12]

$$P_{E/F}(y) = N_{E/F}(1+y) - 1 \equiv S_{E/F}(y) \pmod{\mathfrak{P}_F^m}$$

if  $y$  belongs to  $\mathfrak{P}_E^{d'+\varepsilon'}$ . In this case  $m = m'$  and we take  $m > 2m_1$  so that  $m' - m_1 > d' + \varepsilon'$ . If  $E/F$  is ramified and of degree  $\ell$  we again choose  $m$  sufficiently large that  $m' > 2m_1$ . If  $m > t$

$$\frac{2(m' - m_1) + (\ell - 1)(t + 1)}{\ell} \geq \frac{m' + (\ell - 1)(t + 1)}{\ell} = m$$

so that by Chapter V of [12],

$$\mathcal{P}_{E/F}(y) \equiv S_{E/F}(y) + N_{E/F}(y) \pmod{\mathfrak{P}_F^m}$$

if  $y$  belongs to  $\mathfrak{P}_E^{m'-m_1}$ .  $t$  of course has its usual meaning. Since  $N_{E/F}(y)$  belongs to  $\mathfrak{P}_F^{m'-m_1}$  all we have to do is arrange that  $m' - m_1 \geq m$ . Since

$$m' - m_1 = \ell m - (\ell - 1)(t + 1) - m_1$$

and  $\ell \geq 2$ , this can certainly be done by choosing  $m$  sufficiently large.

To verify the second fact let  $L$  be the fixed field of  $C$ . We can assume that the required assertion is true for the extension  $K/L$ . Let  $\ell = \psi_{L/F}(m - 1) + 1$  and  $\ell' = \psi_{K/F}(m - 1) + 1$ . If  $m$  is sufficiently large and  $H_0$  is the inertial group of  $H$

$$\ell = [H_0 : 1]m - ([H_0 : 1] - 1)$$

and

$$\ell' = [H_0 : 1]m' - ([H_0 : 1] - 1).$$

Thus

$$\mathfrak{P}_L^\ell \cap F = \mathfrak{P}_F^m$$

and if  $\ell_1 = [H_0 : 1]m_1$  then

$$\mathfrak{P}_K^{\ell' - \ell_1} \cap E = \mathfrak{P}_E^{m' - m_1}.$$

If  $m$  and therefore  $\ell$  is sufficiently large

$$P_{K/L}(y) = N_{K/L}(1 + y) - 1 \equiv S_{K/L}(y) \pmod{\mathfrak{P}_L^\ell}$$

if  $y$  belongs to  $\mathfrak{P}_K^{\ell' - \ell_1}$ . Thus if  $y$  belongs to  $\mathfrak{P}_E^{m' - m_1}$

$$P_{E/F}(y) = P_{K/L}(y) \equiv S_{K/L}(y) = S_{E/F}(y) \pmod{\mathfrak{P}_F^m}.$$

To verify the third fact we choose, once  $m'_1$  is given,  $m_1$  so that

$$S_{E'/E} \left( \mathfrak{P}_{E'}^{-\delta_{E'/E} - m'_1} \right) = \mathfrak{P}_E^{-m_1}.$$

If  $m$  is sufficiently large

$$m'' = m' e_{E'/E} - \delta_{E'/E}$$

and if  $y$  belongs to  $\mathfrak{P}_{E'}^{m''-m'_1}$

$$S_{E'/E}(y) \in \mathfrak{P}_E^{m'-m_1}.$$

Taking in even larger if necessary, we have

$$\begin{aligned} P_{E'/F}(y) &\equiv P_{E/F}(P_{E'/E}(y)) \\ &\equiv P_{E/F}(S_{E'/E}(y)) \\ &\equiv S_{E/F}(S_{E'/E}(y)) \\ &\equiv S_{E'/F}(y) \pmod{\mathfrak{P}_F^m}. \end{aligned}$$

Returning to the proof of Lemma 22.5, we choose

$$\beta' = \beta(\chi_{E/F}) = P_{E/F}^*(\beta).$$

If  $m(\chi_F)$  and therefore  $m(\chi_{E/F})$  is sufficiently large,

$$\Delta(\alpha_E^{s-\frac{1}{2}} \mu_E \chi_{E/F}, \psi_{E/F}) = \alpha_E^{s-\frac{1}{2}} \left( \frac{\gamma}{\beta'} \right) \mu_E \left( \frac{\gamma}{\beta'} \right) \Delta(\chi_{E/F}, \psi_{E/F}).$$

Both  $\beta$  and  $\beta'$  are units and therefore

$$\alpha_E^{s-\frac{1}{2}} \left( \frac{\gamma}{\beta'} \right) = \alpha_E^{r-\frac{1}{2}} \left( \frac{\gamma}{\beta} \right) = \alpha_F^{s-\frac{1}{2}} \left( N_{E/F} \left( \frac{\gamma}{\beta} \right) \right) = \alpha_F^{r(s-\frac{1}{2})} \left( \frac{\gamma}{\beta} \right).$$

If  $m(\chi_F)$  is sufficiently large

$$\beta' \equiv \beta \pmod{\mathfrak{P}_E^{m(\mu_E)}}$$

and  $\mu_E(\beta') = \mu_E(\beta)$ . In paragraph 5 we saw that

$$\det \omega \left( \frac{\gamma}{\beta} \right) = \mu_E \left( \frac{\gamma}{\beta} \right) \det \iota_{E/F} \left( \frac{\gamma}{\beta} \right),$$

if  $\iota_{E/F}$  is the representation of  $W_{K/F}$  induced from the trivial representation of  $W_{K/E}$ . We are reduced to showing that

$$\det \iota_{E/F} \left( \frac{\gamma}{\beta} \right) \{\Delta(\chi_F, \psi_F)\}^r = \Delta(\chi_{E/F}, \psi_{E/F}) \rho(E/F, \psi_F) \quad (22.1)$$

if  $m(\chi_F)$  is sufficiently large. Of course  $r = [E : F]$ .

What we do is show that for each Galois extension  $K/F$  the relation (22.1) is true for all fields  $E$  lying between  $K$  and  $F$ . For this we use induction on  $[K : F]$ . Let  $G = \mathfrak{G}(K/F)$  and let  $C$  be a non-trivial abelian normal subgroup of  $G$ . Let  $L$  be the fixed field of  $C$ . We saw in Chapter 13 that there are fields  $F_1, \dots, F_s$  lying between  $F$  and  $L$  and generalized characters  $\mu_1, \dots, \mu_s$  of  $C_{F_1}, \dots, C_{F_s}$  respectively such that

$$\iota_{E/F} \simeq \bigoplus_{i=1}^s \text{Ind}(W_{K/F}, W_{K/F_i}, \mu_i).$$

Then

$$\chi_F \otimes \iota_{E/F} \simeq \bigoplus_{i=1}^s \text{Ind}(W_{K/F}, W_{K/E_i}, \mu_i \chi_{F_i/F})$$

and by Theorem 2.1, the Main Theorem, the right side of (22.1) is equal to

$$\prod_{i=1}^s \Delta(\mu_i \chi_{F_i/F}, \psi_{F_i/F}) \rho(F_i/F, \psi_F).$$

We just saw that if  $m(\chi_F)$  is sufficiently large this is equal to

$$\left\{ \prod_{i=1}^s \mu_i \left( \frac{\gamma}{\beta} \right) \right\} \left\{ \prod_{i=1}^s \Delta(\chi_{F_i/F}, \psi_{F_i/F}) \rho(F_i/F, \psi_F) \right\}.$$

Since

$$\sum_{i=1}^s [F_i : F] = [E : F]$$

we see upon applying the induction assumption to  $L/F$  that this equals

$$\left\{ \prod_{i=1}^s \mu_i \left( \frac{\gamma}{\beta} \right) \det \iota_{F_i/F} \left( \frac{\gamma}{\beta} \right) \right\} \{ \Delta(\chi_F, \psi_F) \}^r.$$

We complete the proof of (22.1) by appealing to Chapter 5 to see that

$$\det \iota_{E/F} = \prod_{i=1}^s \mu_i \det \iota_{F_i/F}.$$
